

## **Appendix 8**

### **Reasonable Alternatives for Non-Strategic Housing Sites**

The following pages set out the appraisals for the reasonable alternatives to the non-strategic housing sites which have been allocated across the Plan area's Sub-Regional Centres, Main Service Centres and Minor Service Centres.

<b>Sub-Regional Centres</b>	<b>Page</b>
Boston	1
Spalding	132
<b>Main Service Centres</b>	
Crowland	462
Donington	516
Holbeach	560
Kirton	630
Long Sutton	686
Pinchbeck	770
Sutterton	808
Sutton Bridge	860
Swineshead	895
<b>Minor Service Centres</b>	
Bicker	932
Butterwick	966
Cowbit	971
Deeping St Nicholas	1002

Wigtoft	1323
Wrangle	1338

## Sub-Regional Centres: Boston

FEN003: Land to the east of Punchbowl Lane, Boston	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 3.87ha Potential open space: 0.39ha Development area: 3.48ha Potential no of dwellings: 116
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓/x
	<p>The nearest open space (off Punchbowl Lane) is approx. 530m from the site and the Peter Paine Sports Centre is around 890m away. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The closest healthcentre (Stuart House Surgery) and community centre (Fenside Community Centre) are both outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 255 people (2.2 occupants in each of the 116 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Boston Fenside does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.39ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	x

	<p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Fenside) showed that 64.5% of households owned at least one car and 33.5% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2.1km from the Asda store in Boston (Lister Way). However, it is outside the ideal 1km walk of a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Boston Distributor Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>The nearest bus stops around 1.2km from the site on Fenside Road, outside the ideal 400m walking distance. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Boston Fenside is a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was above average (28.8% compared to 25.6%) as is the percentage of residents without access to a car (35.5% compared to 18%). Furthermore, statistics show that crime rate per 1000 is well above the county average at 86.9 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Boston's General Business Area (2.3km) are within the ideal 7km drive of the site. However, they are outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the percentage of residents without access to a car is higher than the county average. There are also other potential employment opportunities within the 7km drive elsewhere in Boston.</p>

	<p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 116 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 23 primary pupils and 22 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Boston West Primary Academy is around 1.3km from the site</li> <li>• Boston Grammar School (with 6<sup>th</sup> Form) is approx. 3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 3.5km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 760m from Witham Way, Anton's Gowt to Boston LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is adjacent to the development limits of Boston. It does not have an open countryside character and is dominated by existing development to its south and east. Consequently, development of the site would not have an adverse impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: center;">x</p>

<p><b>Water Resources</b></p>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 3.87ha of Grade 2 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 3.87ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with flood depths of '0.5-1.0m' and 1.0-2.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>The site has a resolution to grant planning permission.</p>
<p><b>12. Climate Change</b></p>	<p style="text-align: center;">✓/x</p> <p>Some of the areas facilities and services are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. This could potentially help to lessen the effects of additional residents in terms of the number of new car journeys generated</p>

	<p>and hence carbon emissions. However, given the anticipated increase in 255 people, it is likely that development of this site would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 255 people within the ideal 7km drive of local employment.. However, it is outside the ideal 1km walk. There are also other potential employment opportunities within the 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (255 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions does not worsen and is detrimental to the economy</p>

<b>FEN004: 36 Witham Bank West, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.29ha Potential no of dwellings: 9
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-</b>	✓/x

<p><b>being</b></p>	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The playing pitch and open space on Carlton Road is around 660m away and Fenside Community Centre is approx. 520m from the site. However, the closest health centre (Stuart House Surgery) is outside the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 20 people (2.2 occupants in each of the 9 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Fenside) showed that 64.5% of households owned at least one car and 33.5% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 810m from the Asda store in Boston (Lister Way). It is also within the ideal 1km walk of a local shop being approx. 570m from the Co-operative store on Argyle Street. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (approx. 760m from the edge of the site) to the proposed route of the Boston Distributor Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>The nearest bus stops around 330m from the site on Carlton Road, within the ideal 400m walking distance. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive</b></p>	<p style="text-align: center;">✓</p> <p>ONS statistics indicate that Boston Fenside is a deprived area: Compared with the Lincolnshire average, its long term unemployment</p>

<p><b>Communities</b></p>	<p>rate was above average (28.8% compared to 25.6%) as is the percentage of residents without access to a car (35.5% compared to 18%). Furthermore, statistics show that crime rate per 1000 is well above the county average at 86.9 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Boston's General Business Area (950m) are within both the ideal 7km drive and 1km walk of the site. There are also other potential employment opportunities within the 7km drive elsewhere in Boston. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 9 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 2 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Carlton Road Academy is around 710m from the site</li> <li>• Boston Grammar School (with 6<sup>th</sup> Form) is approx. 1.8km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 2.2km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p>

	Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 220m from Witham Way, Anton's Gowt to Boston LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. There are also a number of mature trees in the garden which are likely to be affected by development. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">✓/x</p> <p>The majority of the site falls within the Boston Conservation Area. Development of the site could have adverse impacts on the Conservation Area and the neighbouring listed building (38 Castle Street, Grade II listed). Any such impacts could be prevented by careful design.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the development limits of Boston. It is bordered by residential development to the north-west and south-east with Castle Street to the south-west and the River Witham forms a strong boundary along the north-eastern border. Consequently, development of the site would not have an adverse impact on the character of the area</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p>

	The site is not agricultural land.
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.29ha of predominantly greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a mix of danger for most/ danger for some and low hazard and flood depths of from 0m to 1m.. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Boston for the plan period; links to sustainable transport modes; contribution to promoting strong, secure, socially inclusive and cohesive communities; contribution to the protection of the quality and character of landscape and townscape; and contribution to economic growth. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p>

	<p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>The majority of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. This could potentially help to lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 20 people within both the ideal 7km drive and 1km walk of local employment. There are also other potential employment opportunities within the 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (20 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>FEN010: Land to the north of Puritan Way, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 2.16ha Potential open space: 0.22ha Development area: 1.94ha Potential no of dwellings: 65
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.  The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.  Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓/x
	The nearest open space (Grange Wood) is approx. 420m from the site and the Carlton Road playing pitch is around 490m away. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The closest health centre (Stuart House Surgery) and community centre (Fenside Community Centre) are both outside the ideal walking distances.  It is anticipated that the increase in population - approximately 143 people (2.2 occupants in each of the 65 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.  The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.  Overall Boston Fenside does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.22ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.  Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.
<b>3. Transport</b>	✓/x
	It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Fenside) showed that 64.5% of households owned at least one car and 33.5% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.

	<p>The site is well within the ideal short 7km driving distance to a big supermarket being around 1.8km from the Asda store in Boston (Lister Way). However, it is outside the ideal 1km walk of a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Boston Distributor Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>The nearest bus stops around 310m from the site on Shaw Road, within the ideal 400m walking distance. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Boston Fenside is a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was above average (28.8% compared to 25.6%) as is the percentage of residents without access to a car (35.5% compared to 18%). Furthermore, statistics show that crime rate per 1000 is well above the county average at 86.9 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services and facilities are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Boston's General Business Area (1.9km) are within the ideal 7km drive of the site. However, they are outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the percentage of residents without access to a car is higher than the county average. There are also other potential employment opportunities within the 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	No infrastructure will be lost on site as a consequence of this proposal.
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 65 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 13 primary pupils and 12 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Carlton Road Academy is around 1.4km from the site</li> <li>• Boston Grammar School (with 6<sup>th</sup> Form) is approx. 2.8km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 3.2km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 180m from Witham Way, Anton's Gowt to Boston LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is adjacent to the development limits of Boston. It is largely enclosed by the town's built-up area and public views into the site are limited. Consequently, development of the site would not have an adverse impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	x

<p><b>Water Resources</b></p>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains and sewers cross the site - these must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 2.16ha of Grade 2 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 2.16ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a mix of danger for most/ some and low/no hazard in terms of flood hazard, with flood depths between '0-1.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that</p>

	<p>the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Holbeach for the plan period; and potential contribution to the quality and character of landscape and townscape. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some of the areas facilities and services are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions. However, given the anticipated increase in 143 people, it is likely that development of this site would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable</p>

	<p>manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 143 people within the ideal 7km drive of local employment with Boston's General Business Area approx. 1.9km from the site. However, it is outside the ideal 1km walk. There are also other potential employment opportunities within the 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (143 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions does not worsen and is detrimental to the economy</p>
--	--

<b>FEN017: Land to the east of Fenside Road, Boston</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 5.02ha Potential open space: 0.50ha Development area: 4.52ha            Potential no of dwellings: 151</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from defined settlement limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓/x</p> <p>The nearest open space (Grange Wood) is approx. 250m from the site and Carlton Road playing pitch is around 850m away. However other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The closest health centre (Stuart House Surgery) and community centre (Fenside Community Centre) are both outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 332 people (2.2 occupants in each of the 151 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents. The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be</p>

	<p>required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Boston Fenside does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.50ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Fenside) showed that 64.5% of households owned at least one car and 33.5% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2km from the Asda store in Boston (Lister Way). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the site is outside the ideal 1km walk of a local shop meaning that residents would be less likely to cycle or walk to the nearest convenience store. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it could have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Boston Distributor Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday). However, the nearest stop is outside the ideal 400m walking distance meaning that access to public transport for residents is poor.</p>
<b>4. Socially Inclusive</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Boston Fenside is a deprived area: Compared with the Lincolnshire average, its long term unemployment</p>

<p><b>Communities</b></p>	<p>rate was above average (28.8% compared to 25.6%) as is the percentage of residents without access to a car (35.5% compared to 18%). Furthermore, statistics show that crime rate per 1000 is well above the county average at 86.9 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion, contrary to the sustainability objectives of the Local Plan.</p> <p>As discussed in Objective 13, the nearest employment opportunities in Boston's General Business Area (approx. 2.3km away) are within the ideal 7km drive of the site. However, they are outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the percentage of residents without access to a car is higher than the county average. There are also other potential employment opportunities within the 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 151 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 30 primary pupils and 29 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Carlton Road Academy is around 1.7km from the site</li> <li>• Boston Grammar School (with 6<sup>th</sup> Form) is approx. 3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 3.5km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p>

	Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site, being approx. 70m from Witham Way, Anton's Gowt to Boston LWS. There is the potential for increased residential development in this area to have an impact upon the biodiversity of this LWS due to increased footfall along the adjacent Public Right of Way given the recreational opportunities it provides. Additionally, the north-eastern boundary abuts the River Witham and it may be necessary to create a buffer between residential development and the river in order to minimize the likelihood of any adverse effects on wildlife and habitats.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Development of the site would not have an adverse impact on the character and appearance of the area. Although the site has an open countryside character, it is well-related to the town's existing built-up area and is contained by strong western (Fenside Road) and north-eastern (River Witham) boundaries.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 5.02ha of Grade 2 agricultural land.</p>
<b>10. Sustainable use</b>	<p style="text-align: center;">x</p>

<p><b>of Land and Waste</b></p>	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 5.02ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;"><b>x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a mix of danger for most' and danger for some in terms of flood hazard, with flood depths of '0m-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<p><b>12. Climate Change</b></p>	<p style="text-align: center;"><b>✓/x</b></p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. Although, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county, the anticipated increase in 332 people is likely to generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<p><b>13. Economy and Employment</b></p>	<p style="text-align: center;"><b>✓/x</b></p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions does not worsen and is detrimental to the economy</p>
--	--

<b>FIS013: Land to the north of Toot Lane, Boston</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 4.77ha Potential open space: 0.48ha Development area: 4.29ha            Potential no of dwellings: 143</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall, the site has the potential to contribute towards the 6,111 dwellings proposed for the Boston area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to Boston's settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (off Wellington Road) is approx. 640m from the site. However, there is no health centre, leisure centre/publically accessible playing pitches or community centre/village hall within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 315 people (2.2 occupants in each of the 143 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Fishtoft and the majority of Boston town does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality.</p>

	<p>Based on the site area, about 0.48ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Fishtoft) showed that 84.9% of households owned at least one car and 46.9% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2.3km from the Morrisons store in Boston (Horncastle Road). The site is also within the 1km ideal walk to a local shop being approx. 790m from the One Stop store on Kingsway. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston/Fishtoft should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. Increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Fishtoft, in general, is not a deprived ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (19.6% compared to 25.6%) as was its crime rate per 1000 at 28.5 compared to 49.7. Furthermore, the percentage of residents without access to a car is below the county average (15.1% compared to 18%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fis013 is outside the ideal walking distance of some services and facilities which may have an impact on social inclusion. This part of Fishtoft ward is not identified as a deprived area.</p>

	<p>As discussed in Objective 13 the nearest employment opportunities are located at the Boston Port Estate (1.3km) within the ideal 7km drive of the site, although they are outside the ideal 1km walking distance. There are also other employment opportunities at employment sites around Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 143 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 29 primary pupils and 27 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Hawthorn Tree Primary School is around 910m from the site</li> <li>• Boston Grammar School is approx. 2km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 1.5km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest on the site is limited and it does not include any statutory designated sites. However, European and national environmental designations at The Wash are about 3.7km from the site. Mitigation may be required to offset any potential harm identified but this will depend on implementation.</p> <p>There is no geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Development of the site would not have an adverse impact on the character and appearance of the area. It is located adjacent to the development limits of Boston and does not have a countryside character, although its relationship with the existing settlement would be</p>

	<p>improved if the site were to be developed in conjunction with Fis018 to the north.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston/Fishtoft area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains and sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 4.77ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 4.77ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">xx</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly 'danger for all' in terms of flood hazard, with a flood depth of '1.0-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p>

	<p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.</p>
<p><b>12. Climate Change</b></p>	<p style="text-align: center;">✓/x</p> <p>Some local facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is likely that the anticipated increase in 315 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<p><b>13. Economy and Employment</b></p>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 315 people within the ideal 7km drive of employment opportunities in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (315 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>FIS014: Land to the west of Toot Lane, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 4.39ha Potential open space: 0.44ha Development area: 3.95ha Potential no of dwellings: 132
<b>1. Housing</b>	✓
	<p>Overall, the site has the potential to contribute towards the 6,111 dwellings proposed for the Boston area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within Boston's settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. There is no health centre, open space, leisure centre/publically accessible playing pitches or community centre/village hall within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 290 people (2.2 occupants in each of the 132 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Fishtoft and the majority of Boston town does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.44ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	x
	<p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Fishtoft) showed that 84.9% of households owned at least one car and 46.9% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p>

	<p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2.1km from the Morrisons store in Boston (Horncastle Road). However, it is outside the 1km ideal walk to a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston/Fishtoft should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. Increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Fishtoft, in general, is not a deprived ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (19.6% compared to 25.6%) as was its crime rate per 1000 at 28.5 compared to 49.7. Furthermore, the percentage of residents without access to a car is below the county average (15.1% compared to 18%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fis014 is outside the ideal walking distance of some services and facilities which may have an adverse impact on social inclusion and deprivation.</p> <p>As discussed in Objective 13 the nearest employment opportunities are located at the Boston Port Estate (1.9km) within the ideal 7km drive of the site, although they are outside the ideal 1km walking distance. There are also other employment opportunities at employment sites around Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓</p>

	<p>The development would be likely to accommodate 290 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 26 primary pupils and 25 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St Nicholas Church of England Primary School is around 1.6km from the site</li> <li>• Boston Grammar School is approx. 2km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 2.1km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest on the site is limited and it does not include any statutory designated sites. However, European and national environmental designations at The Wash are about 4km from the site. Mitigation may be required to offset any potential harm identified but this will depend on implementation.</p> <p>There is no geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Development of the site would not have an adverse impact on the character and appearance of the area. It is located within the development limits of Boston and relates well to the existing settlement - the site is bordered by residential development on the north, west and part of the southern boundaries.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston/Fishtoft area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 4.39ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 4.39ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">xx</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly 'danger for all' in terms of flood hazard, with a flood depth of '1.0-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some local facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is</p>

	<p>likely that the anticipated increase in 290 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 290 people within the ideal 7km drive of employment opportunities in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (290 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>FIS015: Land to the west of Toot Lane, Boston</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 6.54ha Potential open space: 0.65ha Development area: 5.89ha  Potential no of dwellings: 196</p>
<b>1. Housing</b>	✓
	<p>Overall, the site has the potential to contribute towards the 6,111 dwellings proposed for the Boston area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within/adjacent to Boston's settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a</p>

	<p>community/village hall), the ideal walking distance from housing development for such facilities. There is no health centre, open space, leisure centre/publically accessible playing pitches or community centre/village hall within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 431 people (2.2 occupants in each of the 196 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Fishtoft and the majority of Boston town does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.65ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Fishtoft) showed that 84.9% of households owned at least one car and 46.9% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2.5km from the Morrisons store in Boston (Horncastle Road). However, it is outside the 1km ideal walk to a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston/Fishtoft should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. Increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially</b></p>	<p style="text-align: center;">✓/x</p>

<p><b>Inclusive Communities</b></p>	<p>ONS statistics indicate that Fishtoft, in general, is not a deprived ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (19.6% compared to 25.6%) as was its crime rate per 1000 at 28.5 compared to 49.7. Furthermore, the percentage of residents without access to a car is below the county average (15.1% compared to 18%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fis015 is outside the ideal walking distance of some services and facilities which may have an adverse impact on social inclusion and deprivation.</p> <p>As discussed in Objective 13 the nearest employment opportunities are located at the Boston Port Estate (2.1km) within the ideal 7km drive of the site, although they are outside the ideal 1km walking distance. There are also other employment opportunities at employment sites around Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 196 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 39 primary pupils and 37 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Hawthorn Tree Primary School is around 320m from the site</li> <li>• Boston Grammar School is approx. 2.3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 2.2km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p>

	Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest on the site is limited and it does not include any statutory designated sites. However, European and national environmental designations at The Wash are about 3.9km from the site. Mitigation may be required to offset any potential harm identified but this will depend on implementation. There is no geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Development of the site would not have an adverse impact on the character and appearance of the area. It is located partly within the development limits of Boston although its relationship with the existing settlement would be improved if the site were to be developed in conjunction with Fis014.  The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston/Fishtoft area.  Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.  New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.  Water mains cross the site and must remain accessible. The design of the site should take this into consideration.  The proposal would lead to the permanent loss of approx. 6.54ha of grade 1 agricultural land.</p>
<b>10. Sustainable use</b>	<p style="text-align: center;">x</p>

<p><b>of Land and Waste</b></p>	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 6.54ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;"><b>x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a mix of danger for most and danger for all in terms of flood hazard, with flood depths between '0.5-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<p><b>12. Climate Change</b></p>	<p style="text-align: center;"><b>✓/x</b></p> <p>Some local facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is likely that the anticipated increase in 290 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<p><b>13. Economy and Employment</b></p>	<p style="text-align: center;"><b>✓/x</b></p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 290 people within the ideal 7km drive of employment opportunities in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local</p>

	<p>economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (290 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
--	---

**FIS018: Land to the west of Toot Lane, Boston**

<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 1.06ha Potential open space: 0.11ha Development area: 0.95ha  Potential no of dwellings: 32</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall, the site has the potential to contribute towards the 6,111 dwellings proposed for the Boston area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to Boston’s settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (off Wellington Road) is approx. 960m from the site. However, there is no health centre, leisure centre/publically accessible playing pitches or community centre/village hall within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 70 people (2.2 occupants in each of the 32 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP’s, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Fishtoft and the majority of Boston town does not have enough open space to meet its resident’s needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.11ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p>

	Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.
<b>3. Transport</b>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Fishtoft) showed that 84.9% of households owned at least one car and 46.9% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2km from the Morrisons store in Boston (Horncastle Road). The site is also within the 1km ideal walk to a local shop being approx. 790m from the One Stop store on Kingsway. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this and other sites in the area means that schemes to address traffic impact in and around Boston/Fishtoft should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. Increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Fishtoft, in general, is not a deprived ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (19.6% compared to 25.6%) as was its crime rate per 1000 at 28.5 compared to 49.7. Furthermore, the percentage of residents without access to a car is below the county average (15.1% compared to 18%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fis018 is outside the ideal walking distance of some services and facilities which may have an impact on social inclusion. This part of Fishtoft ward is not identified as a deprived area.</p> <p>As discussed in Objective 13 the nearest employment opportunities are located at the Boston Port Estate (1.7km) within the ideal 7km drive of the site, although they are outside the ideal 1km walking distance. There are also other employment opportunities at employment sites around Boston.</p>

	<p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 32 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 6 primary pupils and 6 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Hawthorn Tree Primary School is around 1km from the site</li> <li>• Boston Grammar School is approx. 2km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 1.9km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest on the site is limited and it does not include any statutory designated sites. However, European and national environmental designations at The Wash are about 3.9km from the site. Mitigation may be required to offset any potential harm identified but this will depend on implementation.</p> <p>There is no geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Development of the site would not have an adverse impact on the character and appearance of the area. It is located adjacent to the development limits of Boston and relates well to the existing built-up area – the site is surrounded by residential development to the north, east and west. The site does not have a countryside character.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>

<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston/Fishtoft area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.06ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">xx</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly ‘danger for all’ with an area of danger for most in terms of flood hazard, and with a flood depth of ‘1.0-2.0m’. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the</p>

	<p>vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.</p>
<b>12. Climate Change</b>	✓/x
	<p>Some local facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is likely that the anticipated increase in 70 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 70 people within the ideal 7km drive of employment opportunities in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (70 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

FIS019: Land to the north of Ward Crescent, Boston	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.15ha Potential no of dwellings: 5
<b>1. Housing</b>	✓
	<p>Overall, the site has the potential to contribute towards the 6,111 dwellings proposed for the Boston area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within Boston's settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. There is no health centre, open space, leisure centre/publically accessible playing pitches or community centre/village hall within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 11 people (2.2 occupants in each of the 5 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	✓/x
	<p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Fishtoft) showed that 84.9% of households owned at least one car and 46.9% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2.8km from the Morrisons store in Boston (Horncastle Road). However, it is outside the 1km ideal walk to a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel</p>

	<p>options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this and other sites in the area means that schemes to address traffic impact in and around Boston/Fishtoft should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. Increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday). The nearest bus stop is just outside the site, well within the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Fishtoft, in general, is not a deprived ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (19.6% compared to 25.6%) as was its crime rate per 1000 at 28.5 compared to 49.7. Furthermore, the percentage of residents without access to a car is below the county average (15.1% compared to 18%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fis019 is outside the ideal walking distance of some services and facilities which may have an adverse impact on social inclusion and deprivation.</p> <p>As discussed in Objective 13 the nearest employment opportunities are located at the Boston Port Estate (2.3km) within the ideal 7km drive of the site, although they are outside the ideal 1km walking distance. There are also other employment opportunities at employment sites around Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 5 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest primary and secondary schools are:</p>

	<ul style="list-style-type: none"> <li>• Hawthorn Tree School is around 400m from the site</li> <li>• Boston Grammar School is approx. 2.7km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 2.6km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest on the site is limited and it does not include any statutory designated sites. However, European and national environmental designations at The Wash are about 3.9km from the site. Mitigation may be required to offset any potential harm identified but this will depend on implementation.</p> <p>There is no geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Development of the site would not have an adverse impact on the character and appearance of the area. It is located within the existing built-up area of Boston and is surrounded by development. Care would need to be taken to ensure a satisfactory relationship to existing neighbouring dwellings.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston/Fishtoft area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>However this site does secure the redevelopment of 0.15ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.15ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as ‘danger for most’ in terms of flood hazard, with flood depths between ‘0.5-1.0m’. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Boston for the plan period; contribution to the protection of the quality and character of landscape and townscape; and the reuse of a brownfield site. If the development can be made safe for its lifetime, it is considered that these</p>

	<p>benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some local facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. However, the anticipated increase in 11 people may only generate a limited number of new car journeys and associated carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 11 people within the ideal 7km drive of employment opportunities in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local</p>

	<p>economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (11 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>
--	--

**FIS023: Land to the south and east of Toot Lane and east of Whitehouse Lane, Boston**

<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 47.9ha Potential open space: 4.79ha Development area: 43.11ha  Potential no of dwellings: 1,437</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall, the site has the potential to contribute towards the 6,111 dwellings proposed for the Boston area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to Boston's settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. However, there is no health centre, open space leisure centre/publically accessible playing pitches or community centre/village hall within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 3,161 people (2.2 occupants in each of the 1,437 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Fishtoft and the majority of Boston town does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 4.79ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from</p>

	other developments elsewhere in the settlement could have a negative impact on physical and mental health.
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Fishtoft) showed that 84.9% of households owned at least one car and 46.9% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2.9km from the Morrisons store in Boston (Horncastle Road). However, it is outside the 1km ideal walk to a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston/Fishtoft should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. Development on this scale is likely to be capable of mitigating any such problems. Increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Fishtoft, in general, is not a deprived ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (19.6% compared to 25.6%) as was its crime rate per 1000 at 28.5 compared to 49.7. Furthermore, the percentage of residents without access to a car is below the county average (15.1% compared to 18%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fis023 is outside the ideal walking distance of some services and facilities which may have an impact on social inclusion. This part of Fishtoft ward is not identified as a deprived area.</p> <p>As discussed in Objective 13 the nearest employment opportunities are located at the Boston Port Estate (1.8km) within the ideal 7km drive of the site, although they are outside the ideal 1km walking distance. There are also other employment opportunities at</p>

	<p>employment sites around Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 1,437 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 287 primary pupils and 273 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Hawthorn Tree Primary School is around 740m from the site</li> <li>• Boston Grammar School is approx. 2.5km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 2km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest on the site is limited and it does not include any statutory designated sites. However, European and national environmental designations at The Wash are about 3.5km from the site. Mitigation may be required to offset any potential harm identified but this will depend on implementation.</p> <p>There is no geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>Development of the site would have an adverse impact on the character and appearance of the area. Its eastern and southern boundaries do not follow strong, 'natural' features and its relationship with the existing settlement is poor owing to the large area of undeveloped land to the north-west. If Fis033 were to be developed in advance of this site it would improve its relationship with the existing built-up area. Development of this scale can offer opportunities to help mitigate any adverse environmental impacts.</p>

	The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.
<b>9. Air, Soil and Water Resources</b>	x
	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston/Fishtoft area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains and sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 47.9ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	x
	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 47.9ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	xx
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly 'danger for all' with an area of danger for most in terms of flood hazard, and with flood depths mainly between '1.0-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p>

	<p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some local facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is likely that the anticipated increase in 3,161 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 3,161 people within the ideal 7km drive of employment opportunities in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (3,161 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

FIS024: Land to the south and east of Toot Lane and east of Whitehouse Lane, Boston	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 35.52ha Potential open space: 3.55ha Development area: 31.97ha Potential no of dwellings: 900
<b>1. Housing</b>	✓
	<p>Overall, the site has the potential to contribute towards the 6,111 dwellings proposed for the Boston area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to Boston's settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. However, there is no health centre, open space leisure centre/publically accessible playing pitches or community centre/village hall within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 1,980 people (2.2 occupants in each of the 900 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Fishtoft and the majority of Boston town does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 3.55ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	x
	<p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Fishtoft) showed that 84.9% of households owned at least one car and 46.9% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p>

	<p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2.8km from the Morrisons store in Boston (Horncastle Road). However, it is outside the 1km ideal walk to a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston/Fishtoft should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. Development on this scale is likely to be capable of mitigating any such problems. Increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Fishtoft, in general, is not a deprived ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (19.6% compared to 25.6%) as was its crime rate per 1000 at 28.5 compared to 49.7. Furthermore, the percentage of residents without access to a car is below the county average (15.1% compared to 18%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fis024 is outside the ideal walking distance of some services and facilities which may have an impact on social inclusion. This part of Fishtoft ward is not identified as a deprived area.</p> <p>As discussed in Objective 13 the nearest employment opportunities are located at the Boston Port Estate (1.7km) within the ideal 7km drive of the site, although they are outside the ideal 1km walking distance. There are also other employment opportunities at employment sites around Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>

<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 900 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 180 primary pupils and 171 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Hawthorn Tree Primary School is around 720m from the site</li> <li>• Boston Grammar School is approx. 2.5km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 1.9km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest on the site is limited and it does not include any statutory designated sites. However, European and national environmental designations at The Wash are about 3.5km from the site. Mitigation may be required to offset any potential harm identified but this will depend on implementation.</p> <p>There is no geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>Development of the site would have an adverse impact on the character and appearance of the area. Its eastern and southern boundaries are arbitrary or do not follow strong, 'natural' features and its relationship with the existing settlement is poor owing to the large area of undeveloped land to the north-west. If Fis033 were to be developed in advance of this site it would improve its relationship with the existing built-up area. Development of this scale can offer opportunities to help mitigate any adverse environmental impacts.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: center;">x</p>

<b>Water Resources</b>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston/Fishtoft area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains and sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 35.52ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 35.52ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">xx</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'predominantly danger for all' with an area of danger for most in terms of flood hazard, and with flood depths mainly between '1.0-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that</p>

	<p>the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some local facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is likely that the anticipated increase in 1,980 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 1,980 people within the ideal 7km drive of employment opportunities in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (1,980 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>FIS025: Land to the south and east of Toot Lane, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 21.21ha Potential open space: 2.12ha Development area: 19.1ha Potential no of dwellings: 636
<b>1. Housing</b>	✓
	<p>Overall, the site has the potential to contribute towards the 6,111 dwellings proposed for the Boston area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to Boston's settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. However, there is no health centre, open space leisure centre/publically accessible playing pitches or community centre/village hall within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 1,399 people (2.2 occupants in each of the 636 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Fishtoft and the majority of Boston town does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 2.12ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	x
	<p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Fishtoft) showed that 84.9% of households owned at least one car and 46.9% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p>

	<p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2.8km from the Morrisons store in Boston (Horncastle Road). However, it is outside the 1km ideal walk to a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston/Fishtoft should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. Development on this scale is likely to be capable of mitigating any such problems. Increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Fishtoft, in general, is not a deprived ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (19.6% compared to 25.6%) as was its crime rate per 1000 at 28.5 compared to 49.7. Furthermore, the percentage of residents without access to a car is below the county average (15.1% compared to 18%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fis025 is outside the ideal walking distance of some services and facilities which may have an impact on social inclusion. This part of Fishtoft ward is not identified as a deprived area.</p> <p>As discussed in Objective 13 the nearest employment opportunities are located at the Boston Port Estate (1.8km) within the ideal 7km drive of the site, although they are outside the ideal 1km walking distance. There are also other employment opportunities at employment sites around Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	No infrastructure will be lost on site as a consequence of this proposal.
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 636 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 127 primary pupils and 121 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Hawthorn Tree Primary School is around 450m from the site</li> <li>• Boston Grammar School is approx. 2.6km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 2km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest on the site is limited and it does not include any statutory designated sites. However, European and national environmental designations at The Wash are about 3.6km from the site. Mitigation may be required to offset any potential harm identified but this will depend on implementation.</p> <p>There is no geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>Development of the site would have an adverse impact on the character and appearance of the area. Its eastern and southern boundaries are arbitrary and its relationship with the existing settlement is poor owing to the large area of undeveloped land to the north-west. If Fis033 were to be developed in advance of this site it would improve its relationship with the existing built-up area. Development of this scale can offer opportunities to help mitigate any adverse environmental impacts.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: center;">x</p>

<b>Water Resources</b>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston/Fishtoft area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 21.21ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 21.21ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">xx</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly 'danger for all' with an area of danger for most in terms of flood hazard, and with a flood depth mainly between '1.0-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this</p>

	appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.
<b>12. Climate Change</b>	✓/x
	<p>Some local facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is likely that the anticipated increase in 1,399 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 1,399 people within the ideal 7km drive of employment opportunities in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (1,399 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>FIS031: Land to the east of Toot Lane, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 3.21ha Potential open space: 0.32ha Development area: 2.89ha Potential no of dwellings: 96
<b>1. Housing</b>	✓
	<p>Overall, the site has the potential to contribute towards the 7,000 dwellings proposed for the Boston area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within/adjacent to Boston's settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. There is no health centre, open space, leisure centre/publically accessible playing pitches or community centre/village hall within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 211 people (2.2 occupants in each of the 96 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Fishtoft and the majority of Boston town does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.32ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	x
	<p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Fishtoft) showed that 84.9% of households owned at least one car and 46.9% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p>

	<p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2.8km from the Morrisons store in Boston (Horncastle Road). However, it is outside the 1km ideal walk to a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston/Fishtoft should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. Increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Fishtoft, in general, is not a deprived ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (19.6% compared to 25.6%) as was its crime rate per 1000 at 28.5 compared to 49.7. Furthermore, the percentage of residents without access to a car is below the county average (15.1% compared to 18%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fis031 is outside the ideal walking distance of some services and facilities which may have an impact on social inclusion. This part of Fishtoft ward is not identified as a deprived area.</p> <p>As discussed in Objective 13 the nearest employment opportunities are located at the Boston Port Estate (2km) within the ideal 7km drive of the site, although they are outside the ideal 1km walking distance. There are also other employment opportunities at employment sites around Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>

<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 96 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 19 primary pupils and 18 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Hawthorn Tree Primary School is around 230m from the site</li> <li>• Boston Grammar School is approx. 2.7km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 2.2km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest on the site is limited and it does not include any statutory designated sites. However, European and national environmental designations at The Wash are about 3.8km from the site. Mitigation may be required to offset any potential harm identified but this will depend on implementation.</p> <p>There is no geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Development of the site would not have an adverse impact on the character and appearance of the area. It is located partly within the development limits of Boston and abuts development to the north and east. If Fis033 were to be developed in advance of this site it would improve its relationship with the existing built-up area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston/Fishtoft area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 3.21ha of grade 1 agricultural land,.</p>
<b>10. Sustainable use of Land and Waste</b>	<b>x</b>
	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 3.21ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<b>x</b>
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly 'danger for most' in terms of flood hazard, with flood depths of '0.5-1.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>The site has a resolution to grant planning permission.</p>
<b>12. Climate Change</b>	<b>✓/x</b>
	<p>Some local facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is likely that the anticipated increase in 211 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p>

	The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓/x
	The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 211 people within the ideal 7km drive of employment opportunities in Boston.
	Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).
	The increased population (211 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.

<b>FRA025: Land to the east of Fen Road, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.85ha Potential no of dwellings: 18
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 6,111 dwellings proposed for the Boston area over the plan period.
	The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.
	However, housing sites outside the defined settlement limits would, in general, be contrary to the principles of the settlement hierarchy.
<b>2. Health and Well-being</b>	x
	The services and facilities that would help to maintain health and promote healthy lifestyles are over the ideal walking distance 1km (600m for a community centre/village hall) from housing development. Wyberton Village Hall, Wyberton playing field, the Woodville Road play area and the health centres in Boston are all outside the ideal walking distances.
	It is anticipated that the increase in population - approximately 40 people (2.2 occupants in each of the 18 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents. The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service

	<p>England.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Wyberton or Boston do not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the potential number of dwellings, open space may be required. However, given the size of the site, it may be more usefully sought as a financial contribution to improve the quality and multifunctionality of existing open space in the area to accommodate future residents.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Frampton and Holme Ward) showed that 94.1% of households owned at least one car and 45% travelled to work by car/van. Both are above the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is inside the ideal 7km distance to a big supermarket, being approx. 1.4km from the Tesco store on New Hammond Beck Road, Boston — the car/van is likely to be the preferred mode of transport for this purpose. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the site is outside the ideal 1km walking distance of a local convenience store. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it could have a positive effect upon promoting sustainable travel options and ensuring that they are available to residents throughout the site particularly for local journeys and everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in Boston should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity to the proposed route of the Boston Distributor Road (approx. 590m away) and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Buses run to Boston and Spalding (Monday-Saturday) - The nearest bus stop is approx. 290m from the site on Swineshead Road, within the ideal 400m walking distance meaning that public transport access for residents is good.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">x</p> <p>ONS statistics depict a varying picture in relation to deprivation of Frampton and Holme Ward: Compared with the Lincolnshire average, its long term unemployment rate was above average (40% compared to 25.6%), but the percentage of residents without access to a car</p>

	<p>was below average (5.9% compared to 18%) as was the crime rate per 1000 (30.1 compared to 49.7).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fra025 is outside the ideal walking distance of many of the area's essential services and facilities meaning that it will be difficult to achieve social inclusion.</p> <p>Furthermore, new housing development may not improve physical access to local employment as Employment Sites are beyond the ideal 1km walking distance from the site, although they could be cycled to. There are also wider employment opportunities available within the ideal 7km drive in Boston town.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 18 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 4 primary pupils and 3 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Boston West Primary Academy approx. 2.6km from the site, and</li> <li>• Boston Grammar School around 4.5km away</li> </ul> <p>There are no post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's, particularly young people.</p>

<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site does not include any statutory designated sites, although it is in close proximity to a protected site being approx. 540m from the South Forty Foot Drain LWS. There is the potential for increased residential development in this area to have an impact upon the biodiversity of this LWS due to increased footfall along the adjacent Public Right of Way.</p> <p>Furthermore, development of the site would be likely to have an adverse impact on mature trees where the site abuts the public highway as well as within the site. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Development of the site would not have an adverse impact on the character and appearance of the area. The site is largely located behind existing development which restricts public views of the site, meaning that its visual impacts would be limited.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly</p>

	<p>relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.85ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">XX</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a mix of danger for most and 'danger for all' in terms of flood hazard, with a flood depth of '1.0-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the area's facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car and the number of residents with access to a car is higher than for the rest of the county. It is likely that the anticipated increase in 40 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. Boston is a Sub Regional Centre. The Local Plan proposes that it will act as a service centre for the surrounding rural area whereby limited new development should support or improve their role as a</p>

	<p>focus for social and economic activity. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 40 people within the ideal 7km drive of employment opportunities in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (40 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
--	---

<b>PIL001: Land to the east of South End, Boston</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario: Total site area: 0.13ha Potential no of dwellings: 5</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Open space (off St John's Road) and the nearest health centre (Greyfriars Surgery) are around 140m and 270m from the site respectively. The closest leisure centre (Boston Leisure Centre) is approx. 670m away. However, there are no community centres within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 11 people (2.2 occupants in each of the 5 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p>

	<p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Pilgrim) showed that 63.1% of households owned at least one car and 30.2% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 820m from the Aldi store in Boston (Queen Street). The site is also within the 1km ideal walk to a local shop being approx. 460m from the Co-operative store on Skirbeck Road. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. The nearest bus stops around 80m from the site outside the Royal Mail Sorting Office, within the ideal 400m walking distance. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Boston Pilgrim ward: Compared with the Lincolnshire average, its long term unemployment rate was just below average (25.5% compared to 25.6%). However, the percentage of residents without access to a car is above the county average (36.9% compared to 18%) as is the crime rate per 1000 at 239 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13 the nearest employment opportunities in the General Business Area (230m) are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are</p>

	<p>also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	✓
	<p>The development would be likely to accommodate 5 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Boston Pioneers Free School is around 480m from the site</li> <li>• Boston Grammar School is approx. 210m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 320m away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	x
	<p>The site is in close proximity to a protected site (South Forty Foot Drain LWS) and so development may have an adverse affect on habitats and BAP species and consequently biodiversity. The site is also within the 5km radius (4.7km) of The Wash Ramsar site (a Wetland of International Importance) and SAC.</p> <p>In its current unused state vegetation has been allowed to grow on site. This could provide space for the development (if not there at present) or enhancement (if already present) of multiple/various habitats which will support a range of species. Development of the site will affect the ecosystem present, by potentially affecting the water table and changing the availability of ground water, unless carefully managed surface water pollution will be a problem. Disturbance due to development can result in the movement of species, therefore undermining their sustainability.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	✓/x
	The site is partially within the Boston Conservation Area and there are a number of listed buildings near to the site. Consequently,

	development of the site may have an adverse impact on historic assets although any such impacts could be prevented by careful design and layout.
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the development limits of Boston and is bordered by residential development to the east and south, the A1138 (South End) to the west and the Royal Mail Sorting Office to the north. Consequently, development of the site is not likely to have an adverse impact on the character of the area.</p> <p>The site is brownfield land (currently unused) and so redevelopment is likely to have a positive impact on townscape, particularly in terms of reinstating a vibrant streetscene and development form in keeping with the adjacent residential properties. Such impact will, however, be dependent on implementation and design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>However this site does secure the redevelopment of 0.13ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.13ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>

<b>11. Flood Risk</b>	<p style="text-align: center; background-color: red; color: black; margin: 0;">XX</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for all' in terms of flood hazard, with flood depths between '0.5-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.</p>
<b>12. Climate Change</b>	<p style="text-align: center; background-color: blue; color: white; margin: 0;">✓/x</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center; background-color: green; color: white; margin: 0;">✓</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 11 people within both the ideal 7km drive and 1km walk of local employment with the General Business Area approx. 230m from the site. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p>

--	--

<b>PIL005: Land to the north of Main Ridge East, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.25ha Potential no of dwellings: 14
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Boston Leisure Centre is approx. 480m from the site and the nearest health centre (Parkside Medical Centre) is around 620m away. The closest open space (Central Park) is approx. 630m from the site. However, there are no community centres within the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 31 people (2.2 occupants in each of the 14 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Boston Pilgrim does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the potential number of dwellings, open space may be required. However, given the size of the site, it may be more usefully sought as a financial contribution to improve the quality and multifunctionality of existing open space in Boston to accommodate future residents.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	✓

	<p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Pilgrim) showed that 63.1% of households owned at least one car and 30.2% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 640m from the Morrisons store in Boston (Horncastle Road). The site is also within the 1km ideal walk to a local shop being approx. 530m from the Co-operative store on Wide Bargate. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. The nearest bus stops around 310m away on John Adams Way, within the ideal 400m walking distance. Buses run multiple times a day through Boston and to Spalding (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Boston Pilgrim ward: Compared with the Lincolnshire average, its long term unemployment rate was just below average (25.5% compared to 25.6%). However, the percentage of residents without access to a car is above the county average (36.9% compared to 18%) as is the crime rate per 1000 at 239 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13 the nearest employment opportunities in the General Business Area (220m) are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	No infrastructure will be lost on site as a consequence of this proposal.
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 14 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 3 primary pupils and 3 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Boston Pioneers Free School is around 990m from the site</li> <li>• Boston Grammar School is approx. 690m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 630m away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 740m from the Maud Foster Drain, Cowbridge to Boston LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the defined settlement limits of Boston and is surrounded by development meaning that public views into the site would be limited. Consequently, development of the site is not likely to have an adverse impact on the character and appearance of the area.</p> <p>The site is entirely brownfield, comprising of disused commercial premises and a car park and so redevelopment is likely to have a positive impact on residential amenity.</p> <p>The contribution, positive or negative, that the development could make to townscape, would depend upon the quality of the design.</p>

<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Demand from the site may place a burden on the existing sewerage system - Anglian Water considers that the foul sewerage network may require upgrading for it to receive foul water from the site or diversion of assets may be required. There is considered to be capacity available at Boston's Water Recycling Centre and in the water supply network to serve the proposed growth. However, across South East Lincolnshire Anglian Water have commented that, in terms of the surface water network, there are major constraints to the provision of infrastructure and/or treatment. Sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 0.25ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.25ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p>

	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as ‘danger for most’ in terms of flood hazard, with a flood depth of ‘0.5-1.0m’. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Boston for the plan period; improving health and well-being; links to sustainable transport modes; reuse of a brownfield site; and contribution to economic growth. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the area’s services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases,</p>

	<p>in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 31 people within both the ideal 7km drive and 1km walk of local employment with the General Business Area approx. 220m from the site. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (31 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>SKI002: Land to the south of Vauxhall Road, Boston</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario: Total site area: 0.13ha Potential no of dwellings: 4</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest amenity open space is located off Freiston Road around 220m away and Boston Leisure Centre is approx. 640m from the site. The closest health centre (Parkside Medical Centre) is around 780m away. However, there are no community centres within the ideal walking distance.</p>

	<p>It is anticipated that the increase in population - approximately 9 people (2.2 occupants in each of the 4 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP’s, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Skirbeck) showed that 70.3% of households owned at least one car and 35.3% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 780m from the Morrisons store in Boston (Horncastle Road). The site is also within the 1km ideal walk to a local shop being approx. 680m from the Co-operative store on Wide Bargate. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents’ everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. The nearest bus stops around 220m away on Freiston Road, within the ideal 400m walking distance. Buses run hourly between Boston and Fishtoft (Monday-Saturday).</p> <p>Development of the site would require the use of a relatively narrow existing vehicular access which may not be suitable.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Boston Skirbeck ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (22.4% compared to 25.6%) as was its crime rate per 1000 at 48.8 compared to 49.7. However, the percentage of residents without access to a car is above the county average (29.7% compared to 18%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside</p>

	<p>other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13 the nearest employment opportunities in the General Business Area (360m) are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 4 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St Nicholas Church of England Primary School is around 880m from the site</li> <li>• Boston Grammar School is approx. 800m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 790m away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity</b>	<p style="text-align: center;">✓/x</p> <p>The site is within the 5km radius (4.9km) of The Wash Ramsar site (a Wetland of International Importance) and SAC. Mitigation may be</p>

<b>and Green Infrastructure</b>	<p>required to offset any potential harm identified but this will depend upon implementation.</p> <p>There is no geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the defined settlement limits of Boston and is surrounded by residential development meaning that public views into the site would be limited. Consequently, development of the site is not likely to have an adverse impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape, would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 0.25ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p>

	<p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.25ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with a flood depth of '1.0-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Boston for the plan period; improving health and well-being; links to sustainable transport modes; contributing to the protection of the quality and character of landscape and townscape; and contribution to economic growth. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>SKI003: Land to the north-east of Freiston Road, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: Potential no of dwellings: 8
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.  The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.  Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓
	The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest amenity open space is located behind the site around 130m away and Boston Leisure Centre is approx. 630m from the site. If a new access were to be incorporated into the north-eastern boundary of the site this would have a positive impact on the resident's access to open space by bringing the adjacent playing field within 30m. The closest health centre (Parkside Medical Centre) is around 880m away. However, there are no community centres within the ideal walking distance.  It is anticipated that the increase in population - approximately 18 people (2.2 occupants in each of the 8 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.  The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.  Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.
<b>3. Transport</b>	✓
	It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Skirbeck) showed that 70.3% of households owned at least one car and 35.3% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.  The site is well within the ideal short 7km driving distance to a big supermarket being around 780m from the Morrisons store in Boston

	<p>(Horncastle Road). The site is also within the 1km ideal walk to a local shop being approx. 760m from the Co-operative and One Stop stores on Eastwood Road. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area. The nearest bus stops around 190m away on Freiston Road, within the ideal 400m walking distance. Buses run hourly between Boston and Fishtoft (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Boston Skirbeck ward: Compared with the Lincolnshire average, its long term unemployment rate was below average (22.4% compared to 25.6%) as was its crime rate per 1000 at 48.8 compared to 49.7. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 0.26ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.26ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly 'danger for most' in terms of flood hazard, with a flood depth of '1.0-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the</p>

	<p>vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Boston for the plan period; improving health and well-being; links to sustainable transport modes; reuse of a brownfield site; and contribution to economic growth. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and</b>	✓

<b>Employment</b>	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 18 people within both the ideal 7km drive and 1km walk of local employment with the General Business Area approx. 450m from the site. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (18 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>
-------------------	--

<b>SOU001: Land to the west of Wyberton Low Road, Boston</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 3.29ha Potential open space: 0.33ha Development area: 2.96ha            Potential no of dwellings: 99</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest health centre, open space, sports facilities and community centre are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 218 people (2.2 occupants in each of the 99 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed</p>

	<p>with the CCGs and National Health Service England.</p> <p>Overall Boston South does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.33ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the western boundary of the site is adjacent to the A16 which may have an adverse impact on the amenities that would be enjoyed by new residential dwellings. Any adverse effects should be appropriately mitigated through careful design and layout for example. Structural landscaping such as trees of mixed provenance, may be necessary along this boundary to help mitigate any noise and air pollution as well as helping to minimise the visual impact generated through proximity to the road network.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston South) showed that 89.7% of households owned at least one car and 48.5% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 2.4km from the Aldi store in Boston (Queen Street). However, it is outside the ideal 1km walk of a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Boston Distributor Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>The nearest buses stop on London Road well outside the ideal 400m walking distance. Buses run to Kirton and Spalding and into the centre of Boston multiple times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Boston South is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (21.4% compared to 25.6%) as is the percentage of residents without access to a car (10.3% compared to 18%). Furthermore, statistics show that crime rate per 1000 is below the county average at 36.3 compared to 49.7.</p>

	<p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at the Riverside Industrial Estate (750m) are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 99 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 20 primary pupils and 19 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St Thomas' Church of England Primary School is around 370m from the site</li> <li>• Boston Grammar School (with 6<sup>th</sup> Form) is approx. 2.3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 2.8km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity,</b>	✓/x

<b>Geodiversity and Green Infrastructure</b>	<p>The site is in close proximity to a protected site (approx. 660m from the South Forty Foot Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. It is also within the 5km radius (3.9km) of The Wash Ramsar site (a Wetland of International Importance) and SAC.</p> <p>Development of the site may have an adverse impact on any wildlife and habitats within the drainage channel along the northern facing boundary of the site. Disturbance due to development can result in the movement of species, therefore undermining their sustainability. Mitigation may be required to offset any potential harm identified but this will depend upon implementation.</p> <p>There are also trees along the southern and western boundaries. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation. There may be some opportunity to retain trees along the southern and western boundaries in mitigating the effects of the site's close proximity to the A16.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is adjacent to the development limits of Boston. It does not have an open countryside character and is visually dominated by neighbouring residential development. Consequently, development of the site would not have an adverse impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p>

	The proposal would lead to the permanent loss of approx. 3.29ha of Grade 1 agricultural land.
<b>10. Sustainable use of Land and Waste</b>	x
	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 3.29ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	xx
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for all' in terms of flood hazard, with a flood depth of '1.0-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.</p>
<b>12. Climate Change</b>	✓/x
	<p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car and car ownership is above average for the county. It is therefore likely that the anticipated increase in 218 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through</p>

	<p>the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 218 people within the ideal 7km drive and 1km walk of local employment with the Riverside Industrial Estate approx. 750m from the site. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (218 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions does not worsen and is detrimental to the economy</p>

<b>SOU007: Former Norton Lea Hospital, London Road, Boston</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 2.08ha Potential open space: 0.21ha Development area: 1.87ha  Potential no of dwellings: 62</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>The nearest accessible playing pitches (off Garfit's Lane) and the recreational route along the South Forty Foot Drain and River Haven are approx. 420m and 390m from the site respectively. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest health centre and community centre are both outside the ideal walking distances.</p>

	<p>It is anticipated that the increase in population - approximately 136 people (2.2 occupants in each of the 62 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Boston South does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.21ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the eastern boundary of the site is adjacent to the A16 and the roundabout adjoining Marsh Lane which may have an adverse impact on the amenities that would be enjoyed by new residential dwellings. Any adverse effects should be appropriately mitigated through careful design and layout for example. Structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution as well as helping to minimise the visual impact generated through proximity to the road network.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston South) showed that 89.7% of households owned at least one car and 48.5% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 1.5km from the Aldi store in Boston (Queen Street). It is also within the ideal 1km walk of a local shop being approx. 350m from the Spar store on London Road. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (approx. 290m from the edge of the site) to the proposed route of the Boston Distributor Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>The nearest buses stop on London Road approx. 180m from the site, within the ideal 400m walking distance. Buses run to Kirton and Spalding and into the centre of Boston multiple times a day (Monday-Saturday).</p>

<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Boston South is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (21.4% compared to 25.6%) as is the percentage of residents without access to a car (10.3% compared to 18%). Furthermore, statistics show that crime rate per 1000 is below the county average at 36.3 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13 the nearest employment opportunities at the Riverside Industrial Estate (420m) are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓</p> <p>The development would be likely to accommodate 62 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 12 primary pupils and 12 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St Thomas' Church of England Primary School is around 620m from the site</li> <li>• Boston Grammar School (with 6<sup>th</sup> Form) is approx. 1.5km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 1.9km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a</p>

	<p>new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 300m from the South Forty Foot Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. It is also within the 5km radius (4.3km) of The Wash Ramsar site (a Wetland of International Importance) and SAC. Mitigation may be required to offset any potential harm identified but this will depend upon implementation.</p> <p>Furthermore, development of the site may have an adverse impact on a number of mature trees lining all boundaries. There is also a tree protected by the Boston No. 29 Tree Preservation Order. However, due to the size of the site it is likely that any adverse impact could be minimized by careful layout, care being taken to ensure that no development occurs within the Root Protection Areas of the tree as calculated using British Standard 5837:2012.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on the Grade II listed Church of St Thomas on the northern side of London Road. However, any such impacts could be prevented by careful design and layout.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the development limits of Boston and is contained by London Road to the north, the A16 to the east, an employment use to the south and residential development to the west. Furthermore, the site is well screened by mature trees and so public views into the site would be limited. Consequently, development of the site would not have an adverse impact on the character and appearance of the area.</p> <p>The site is a former institutional development of low townscape value. Redevelopment is therefore likely to have a positive impact upon townscape, however this would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p>

	<p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 2.08ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 2.08ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">xx</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for all' in terms of flood hazard, with a flood depth of '1.0-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. However, given that travel to work use by car and car ownership is higher than for the rest of the county it is likely that the anticipated increase in 136 people would generate new car journeys and hence carbon emissions.</p>

	<p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 136 people within the ideal 7km drive and 1km walk of local employment with the Riverside Industrial Estate approx. 420m from the site. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (136 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions does not worsen and is detrimental to the economy</p>

<b>STN001: Land to the west of Carlton Road, Boston</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario: Total site area: 0.18ha Potential no of dwellings: 6</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a</p>

	<p>community/village hall), the ideal walking distance from housing development for such facilities. Open space off Sleaford Road and Boston Tennis Club are around 580m and 870m from the site respectively. Furthermore, the closest health centre (Stuart House Surgery) is approx. 540m away and Fenside Community Centre is around 410m from the site.</p> <p>It is anticipated that the increase in population - approximately 13 people (2.2 occupants in each of the 6 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Staniland North) showed that 65.6% of households owned at least one car and 32.5% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 600m from the Asda store in Boston (Lister Way). It is also within the ideal 1km walk of a local shop being approx. 290m from the Co-operative store on Argyle Street. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (approx. 970m from the edge of the site) to the proposed route of the Boston Distributor Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>The nearest bus stops around 140m from the site on Carlton Road, within the ideal 400m walking distance. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday).</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓</p> <p>ONS statistics indicate that Boston Staniland North is a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was above average (29.2% compared to 25.6%) as is the percentage of residents without access to a car (33.3%</p>

	<p>compared to 18%). Furthermore, statistics show that crime rate per 1000 is well above the county average at 180.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Boston's General Business Area (530m) are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 6 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Carlton Road Academy is around 190m from the site</li> <li>• Boston Grammar School (with 6<sup>th</sup> Form) is approx. 1.4km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 1.8km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of</p>

	the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 640m from Witham Way, Anton's Gowt to Boston LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. There are also some mature trees along the eastern boundary of the site which may be affected by development. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the development limits of Boston and is surrounded by residential development. Consequently, development of the site would not have an adverse impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>However this site does secure the redevelopment of 0.18ha of predominantly previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use</b>	✓

<p><b>of Land and Waste</b></p>	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.18ha of predominantly previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center; background-color: red; color: white;">XX</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly 'danger for all' in terms of flood hazard, with flood depths between '0.5-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would deliver limited sustainability benefits to the community which would not outweigh the flood risk identified for this site.</p>
<p><b>12. Climate Change</b></p>	<p style="text-align: center; background-color: lightblue; color: black;">✓/x</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>

<b>13. Economy and Employment</b>	✓
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 13 people within both the ideal 7km drive and 1km walk of local employment with Boston's General Business Area approx. 530m from the site. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (13 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STN006: 2 Fydell House, Fydell Street, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.10ha Potential no of dwellings: 13
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The open space of Central Park and Stuart House Surgery are around 460m and 760m from the site respectively. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Fenside Community Centre and the nearest sports facilities (Boston Tennis Centre) are both outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 29 people (2.2 occupants in each of the 13 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff.</p>

	<p>In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Boston Staniland North does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the potential number of dwellings, open space may be required. However, given the size of the site, it may be more usefully sought as a financial contribution to improve the quality and multifunctionality of existing open space in Boston to accommodate future residents.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is adjacent to the railway line. Structural landscaping such as trees of mixed provenance, may be necessary along the eastern boundary to help mitigate any noise and air pollution as well as helping to minimise the visual impact generated through proximity to the rail network.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Staniland North) showed that 65.6% of households owned at least one car and 32.5% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket and 1km walk of a local shop/supermarket, being around 530m from the Asda store in Boston (Lister Way). Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops around 360m from the site on Lister Way, outside the ideal 400m walking distance. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>ONS statistics indicate that Boston Staniland North is a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was above average (29.2% compared to 25.6%) as is the percentage of residents without access to a car (33.3% compared to 18%). Furthermore, statistics show that crime rate per 1000 is well above the county average at 180.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing</p>

	<p>and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>A number of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Boston's General Business Area (690m) are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 13 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 3 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Carlton Road Academy is around 660m from the site</li> <li>• Haven High Technology College is approx. 990m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 2km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 630m from Witham Way, Anton's Gowt to Boston LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>

<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the development limits of Boston in a primarily residential area and is bordered by the railway line to the east and the Asda store to the south. Consequently, development of the site would not have an adverse impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 0.10ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.10ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p>

	This site is not within a Mineral Safeguarding Area.
<b>11. Flood Risk</b>	<p style="text-align: center;"><b>x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a mix of danger for all and danger for most plus an area of no hazard in terms of flood hazard, with flood depths between no hazard up to 2.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>A number of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;"><b>✓</b></p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 29 people within both the ideal 7km drive and 1km walk of local employment with Boston's General Business Area approx. 690m from the site. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (29 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STS002: Land to the west of Frampton Place, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.13ha Potential no of dwellings: 4
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.  The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.  Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓/x
	The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Open space off Sleaford Road and the nearest sports facilities (Boston Tennis Club) are approx. 340m and 740m from the site respectively, whilst the closest health centre (Stuart House Surgery) is around 450m away. However there is no community centre within easy walking distance.  It is anticipated that the increase in population - approximately 9 people (2.2 occupants in each of the 4 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.  The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.  Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.
<b>3. Transport</b>	✓
	It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Staniland South) showed that 66.7% of households owned at least one car and 33.6% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.  The site is well within the ideal short 7km driving distance to a big supermarket being around 520m from the Asda store in Boston (Lister Way). The site is also within the 1km ideal walk to a local shop being approx. 400m from the Co-operative store on Woodville Road. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday

	<p>shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops around 260m from the site on Woodville Road, within the ideal 400m walking distance. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Boston Staniland South is a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was above average (29.3% compared to 25.6%) as is the percentage of residents without access to a car (34.4% compared to 18%). Furthermore, statistics show that crime rate per 1000 is above the county average at 68.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Boston's General Business Area (480m) are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p>

	<p>The development would be likely to accommodate 4 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Boston Staniland Primary and Nursery School is around 480m from the site</li> <li>• Boston Grammar School is approx. 1.3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 1.7km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 790m from South Forty Foot Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. Additionally, there are large trees on the northern boundary which could be affected by the development. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the development limits of Boston and is surrounded by residential development. It is located behind frontage development which restricts public views of the site. Consequently, its development would not have an adverse impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: center;">✓</p>

<p><b>Water Resources</b></p>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>However this site does secure the redevelopment of 0.13ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.13ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as ‘danger for all’ in terms of flood hazard, with a flood depth of ‘1.0-2.0m’. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this</p>

	<p>appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Boston for the plan period; links to sustainable transport modes; reuse of a brownfield site; and contribution to economic growth. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car and car ownership is higher here than for the rest of the county. However it is likely that the anticipated increase in 9 people would only generate a limited number of new car journeys and associated carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East</p>

	<p>Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 9 people within both the ideal 7km drive and 1km walk of local employment with Boston's General Business Area approx. 480m from the site. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p>
--	---

WIT008: Land to the south of Norfolk Street, Boston	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 1.21ha Potential open space: 0.12ha Development area: 1.09ha            Potential no of dwellings: 36</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓/x
	<p>The nearest open space (Central Park) and medical centre (Parkside Medical Centre) are approx. 260m and 330m from the site respectively. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The closest accessible playing pitch (off Sheriff Way) and nearest community centre are outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 79 people (2.2 occupants in each of the 36 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Boston Witham has enough open space to meet its resident's needs. However, the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.12ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through</p>

	<p>the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is opposite Boston Trade Park which generates vehicular traffic. This may have an impact on the amenities that would be enjoyed by residents living within the site.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Witham) showed that 69.3% of households owned at least one car and 35.5% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is within the ideal short 7km driving distance and 1km walk to a big supermarket and/or local shop being around 390m from the Morrisons store in Boston (Horncastle Road). Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops around 360m from the site on Tawney Street, within the ideal 400m walking distance. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>ONS statistics indicate that Boston Witham is a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was above average (33.7% compared to 25.6%) as is the percentage of residents without access to a car (30.7% compared to 18%). Furthermore, statistics show that crime rate per 1000 is well above the county average at 141 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p>

	<p>As discussed in Objective 13 the nearest employment opportunities at Boston Trade Park (80m) are within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 36 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 7 primary pupils and 7 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Boston Park Community Primary School is around 790m from the site</li> <li>• Haven High Technology College is approx. 670m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 1.8km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 200m from the Maud Foster Drain, Cowbridge to Boston LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within Boston's built-up area and is bordered by residential development to the east and south, Norfolk Street to the north and</p>

	<p>employment premises to the west. Consequently, development of the site would not have an adverse impact on the character and appearance of the area.</p> <p>The site is brownfield land (largely unused industrial buildings) and so redevelopment is likely to have a positive impact on townscape, particularly in terms of reinstating a vibrant streetscene and development form in keeping with the residential properties to the east and south. Given the current use, the redevelopment is also likely to have a positive impact on the residential amenity of these properties. Such impact will, however, be dependent on implementation and design.</p>
<p><b>9. Air, Soil and Water Resources</b></p>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Demand from the site may place a burden on the existing sewerage system - Anglian Water considers that the foul sewerage network may require upgrading for it to receive foul water from the site or diversion of assets may be required. There is considered to be capacity available at Boston's Water Recycling Centre and in the water supply network to serve the proposed growth. However, across South East Lincolnshire Anglian Water have commented that, in terms of the surface water network, there are major constraints to the provision of infrastructure and/or treatment. Water mains and sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 1.21ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p>

	<p>However this site does secure the redevelopment of 1.21ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: right;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly 'danger for most' in terms of flood hazard, with flood depths between '0.5-2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Boston for the plan period; links to sustainable transport modes; promoting strong, secure, socially inclusive and cohesive communities; and reuse of a brownfield site. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: right;">✓/x</p>

	<p>Some of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. However it is likely that the anticipated increase in 79 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<p><b>13. Economy and Employment</b></p>	<p style="text-align: center;">xx</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 79 people within the ideal 7km drive and 1km walk of local employment with Boston Trade Park approx. 80m from the site. Although this will ensure that there is potentially an accessible workforce within the town catchment to continue to support businesses, the development of this site for housing would see the loss of allocated employment land (1.21ha). Furthermore, the site is of strategic scale, the loss of which could have a negative impact on the potential for the local economy to provide jobs for local residents. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (79 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>WIT009: Land to the north of Fountain Lane, Boston</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.29ha Potential no of dwellings: 9
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓/x
	<p>The nearest open space (Central Park) and medical centre (Parkside Medical Centre) are approx. 260m and 410m from the site respectively. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The closest leisure centre (Boston Leisure Centre) and community centre are outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 20 people (2.2 occupants in each of the 9 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	✓
	<p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Boston Witham) showed that 69.3% of households owned at least one car and 35.5% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is within the ideal short 7km driving distance to a big supermarket being around 660m from the Morrisons store in Boston (Horncastle Road). The site is also within the ideal 1km walking distance of a local shop being approx. 240m from the Co-operative Store on Wide Bargate. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p>

	<p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops around 290m from the site on Wide Bargate, within the ideal 400m walking distance. An intertown bus service runs in Boston with buses departing every hour, 12 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>ONS statistics indicate that Boston Witham is a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was above average (33.7% compared to 25.6%) as is the percentage of residents without access to a car (30.7% compared to 18%). Furthermore, statistics show that crime rate per 1000 is well above the county average at 141 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13 the nearest employment opportunities are in very close proximity to the site as it is located within Boston's General Business Area. This would have a positive impact, providing good access for residents to local employment. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 9 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 2 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p>

	<ul style="list-style-type: none"> <li>• Boston Pioneers Free School is around 750m from the site</li> <li>• Boston Grammar School is approx. 710m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 1.2km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 740m from the Maud Foster Drain, Cowbridge to Boston LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">✓/x</p> <p>The site could have adverse impacts on historic assets as it is located within the Boston Conservation Area and the majority of buildings to the west are Grade II listed. Boston Sessions House to the south is Grade II*. However, any such impacts could be prevented by careful design.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within Boston's built-up area and is bordered by residential and retail development to the north and west, Fountain Lane to the south and Fountain Place to the east. Consequently, development would not have an adverse impact on the character and appearance of the area.</p> <p>The site is brownfield (currently an unused car park) and so redevelopment is likely to have a positive impact on townscape, particularly in terms of reinstating a vibrant streetscene. Such impact will, however, be dependent on implementation and design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>However this site does secure the redevelopment of 0.29ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.29ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a mix of danger for all and danger for most in terms of flood hazard, with flood depths between '0.25-1.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Boston for the plan period; links to sustainable transport modes; promoting strong, secure, socially inclusive and cohesive communities; reuse of a brownfield site; and contribution to economic growth. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p>

	<p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. It is likely that the anticipated increase in 20 people would only generate a limited number of new car journeys and associated carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site would be important to the delivery of the settlement hierarchy as it is likely that new development could have a positive impact on the local economy by bringing 20 people within the ideal 7km drive and 1km walk of local employment as the site is within Boston's General Business Area. There are also other potential employment opportunities within the ideal 7km drive elsewhere in Boston.</p>

	<p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (20 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>
--	--

<b>WYB040: Disused petrol station, London Road, Boston</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 0.26ha Potential open space: 0.03ha Development area: 0.23ha            Potential no of dwellings: 8</p>
<b>1. Housing</b>	✓
	<p>Overall, the site has the potential to contribute towards the 6,111 dwellings proposed for Boston over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Boston and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within defined settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The nearest playing field (off Garfit's Lane) is within the ideal 1km walk. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The closest health centre, open space, and community centre/village hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 18 people (2.2 occupants in each of the 8 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used. The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Boston area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is adjacent to a timber merchant's which could have an adverse impact on the amenities that would be enjoyed by new dwellings on the site. Structural landscaping such as trees of mixed provenance may be necessary to help mitigate any noise and air pollution. Design and layout should be considered carefully.</p>

<b>3. Transport</b>	<p style="text-align: right;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car use – ONS 2011 census data (Wyberton ward) showed that 85.3% of households owned at least one car and 49.5% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1% respectively.</p> <p>The site is within the ideal distance of a supermarket (7km) being approx. 2.2km from the Aldi store in Boston – the car/van is likely to be the preferred mode of transport for this purpose. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the site is outside the ideal 1km walk of the nearest local shop (Spar store on London Road) which may discourage the use of more sustainable modes of transport.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Boston should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in very close proximity to the proposed route of the Boston Distributor Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Buses run to Boston, Kirton and Spalding multiple times a day (Monday – Saturday). The nearest bus stops approx. 260m from the site on London Road, within the ideal 400m walking distance. Therefore there is good public transport access for residents.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Wyberton ward is not generally a deprived area, for example: Compared with the Lincolnshire average, the percentage of residents without access to a car is below the county average (14.7% compared to 18%) and its crime rate per 1000 is also just below average at 47.2 compared to 49.7. However, its long term unemployment rate was above average (35.7% compared to 25.6%).</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's facilities and services are outside the ideal walking distances which could have an adverse impact on social inclusion, contrary to the sustainability objectives of the Local Plan.</p> <p>As discussed in Objective 13, the nearest potential employment opportunities at the Redstone Industrial Estate (1.3km) are within the preferred 7km driving distance. However, there are also other employment opportunities within the 7km drive in Boston. This would have</p>

	<p>a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 8 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 2 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Wyberton Primary School is around 1.3km from the site</li> <li>• Boston Grammar School is approx. 2.3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Rochford Campus) being approx. 2.8km away.</p> <p>The local education authority has indicated that there is currently no capacity available in Boston at primary and secondary level, as well as in the town's sixth forms, to accommodate the number of pupils new housing development is anticipated to generate. Overall there is a requirement for a new secondary school in Boston with sixth form capacity as well as additional primary capacity to be provided via a new school and extending existing primary schools.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest in the site appears to be limited, although the site is in close proximity to a protected site (approx. 180m from Tytton Lane West Pits, East LWS) meaning that development may have an effect on habitats and BAP species and consequently biodiversity. European and national environmental designations at The Wash are about 4.5km from the site. Mitigation may be required to offset any potential harm identified but this will depend on implementation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>The site and surrounding area is not known to have any significant historic or culturally-significant features.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The sites redevelopment would not have an adverse impact on the character and appearance of the area. The site is located within Boston's existing built-up area and is surrounded by development on all sides.</p>

	<p>Redevelopment of the site could have a positive impact on the townscape of the area given its current disused state. However, its impact would ultimately depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Boston area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>However this site would secure the redevelopment of 0.26ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site would secure the redevelopment of 0.26ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as danger for all in terms of flood hazard, with flood depths of 1-2m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p>

	<p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Boston for the plan period; to contribute to the improvement of the quality and character of landscape and townscape; and reuse of a brownfield site. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the area's facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 18 people would generate some new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Boston area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>It is likely that the electricity network in this area of Boston Borough would need to undergo reinforcement works to release new capacity to cope with new residential development in this area.</p>

	<p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<p><b>13. Economy and Employment</b></p>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Boston will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this, it is likely that new development could have a positive impact on the local economy by bringing 18 people within the ideal 7km drive of employment opportunities in Boston which will help support businesses.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (18 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

## Sub-Regional Centres: Spalding

MON001: Land to the north of Bourne Road, Pode Hole	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 1.49ha Potential open space: 0.21ha Development area: 1.28ha Potential no of dwellings: 45
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space and playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre/village hall (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 99 people (2.2 occupants in each of the 45 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monk's House does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.21ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	x

	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk’s House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.8km from the Aldi store in Spalding (St Thomas’s Road). However, it is outside the ideal 1km walking distance from the nearest local shop (Premier store on Pennygate) meaning that residents would be less likely to use more sustainable modes of transport to meet their everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (approx. 60m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Spalding Monk’s House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>A number of the area’s services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.8km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p>

	<p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 22 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 9 primary pupils and 9 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Monkshouse Primary School is around 1.9km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.2km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.2km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in anticipated in the area. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan)</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on mature trees and hedging along the northern, eastern and western boundaries. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation. Due to the size of the site it is likely that any impacts could be minimised by careful layout. The site is also within approx. 290m of a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed</p>

	development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is detached from the development limits of Spalding and there are primarily open countryside views to the north. However, the site is currently an industrial site and is bordered by frontage development. There is also Lincolnshire County Council's Highways depot to the west. Consequently, the site's development is not likely to adversely alter the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓/x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The site is recorded on the South Holland contaminated land register meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>However this site does secure the redevelopment of previously-developed land (1.49ha) which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p>

	<p>However this site does secure the redevelopment of previously-developed land (1.49ha) which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;"><b>✓/x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard and flood depth of 0.5m-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including not likely having an adverse impact on the landscape and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<p><b>12. Climate Change</b></p>	<p style="text-align: center;"><b>✓/x</b></p> <p>A number of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 99 people would generate new car journeys and hence</p>

	<p>carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 99 people within the ideal 7km drive of local employment. However, while this will ensure that there is potentially an accessible workforce within the town catchment to continue to support businesses, the development of this site for housing would see the loss of employment land (1.49ha) which could have a negative impact on the potential for the local economy to provide jobs for local residents.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (99 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

MON002: Land to the south of Horseshoe Lane, Spalding	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.33ha Potential no of dwellings: 10
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p>

	<p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>The nearest open space (off Kimblewick Lane) is approx. 660m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk’s House Playing Field), health centre (Pennygate Health Centre) and community centre/village hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 22 people (2.2 occupants in each of the 10 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP’s, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The site is also in close proximity to the proposed route of the Spalding Western Relief Road which may have an impact on the amenities that would be enjoyed by the residents of new dwellings. Consequently, structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk’s House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.3km from the Aldi store in Spalding (St Thomas’s Road). However, the site is outside the ideal 1km walking distance from a local shop being 1.9km from the Premier store on Pennygate. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (approx. 540m from the edge of the site) to the proposed route of the Spalding Western Relief Road and</p>

	<p>therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding Monk's House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.2km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 10 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 2 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John's the Baptist Church of England Primary School is around 1.5km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.6km away</li> </ul>

	<p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.7km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">0</p> <p>The site appears to be free of environmental constraints and it does not include, as is not in close proximity to any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Although the site is detached from the development limits of Spalding it is adjacent to existing residential development meaning that it is not likely to have an adverse impact on the character and appearance of the landscape.</p> <p>Furthermore, the site appears to be partially disused with poor quality buildings and so the site's development would likely have a positive impact on the environment, although its overall impact would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction</p>

	<p>could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains and sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 0.33ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.33ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and flood depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including not likely having an adverse impact on the landscape, redevelopment of previously developed land and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the</p>

	<p>design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 22 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 22 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. Safe access and egress will be required to ensure that the impact</p>

	on the local road network does not worsen and is detrimental to the economy.
--	--

<b>MON004: Land to the north of Bourne Road, Pode Hole</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 2.01ha Potential open space: 0.28ha Development area: 1.73ha Potential no of dwellings: 60
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>Access to the recreational route alongside Vernatt's Drain is approx. 500m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre/village hall (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 132 people (2.2 occupants in each of the 60 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.28ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The site is also in close proximity to the proposed route of the Spalding Western Relief Road and is adjacent to Lincolnshire County Council's Highways depot</p>

	<p>which may have an impact on the amenities that would be enjoyed by the residents of new dwellings. Consequently, structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk’s House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 3km from the Aldi store in Spalding (St Thomas’s Road). However, it is outside the ideal 1km walking distance from the nearest local shop (Premier store on Pennygate) meaning that residents would be less likely to use more sustainable modes of transport to meet their everyday shopping needs</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding Monk’s House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area’s services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (3km) are within the ideal 7km drive of the</p>

	<p>site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 60 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 12 primary pupils and 11 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Monkshouse Primary School is around 2.1km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.4km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site is not likely to have an adverse impact on any trees or vegetation. However, the site is within approx. 110m of a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. It would be necessary to create a buffer between residential development and the Drain in order to minimize the likely adverse effects.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p>

	<p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is detached from the development limits of Spalding. However, the site is bounded by development on three sides. Lincolnshire County Council's Highways depot is adjacent to the site to the east, residential development fronting the A151 Bourne Road is to the south and a horticultural nursery is situated to the west. Consequently, the site's development is not likely to adversely alter the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 2.01ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p>

	<p>The proposal would lead to the permanent loss of approx. 2.01ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and the majority is identified within the SFRA as 'danger for most' in terms of flood hazard, with some being 'danger for some'. The majority of the site has flood depths of 0.5-1.0m, although a small part of the site is 0.25-0.5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including not likely having an adverse impact on the character of the area and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for</p>

	<p>the rest of the county. It is therefore likely that the anticipated increase in 132 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 132 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (132 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

MON007: Land to the south of Horseshoe Road, Spalding	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 6.94ha Potential open space: 0.97ha Development area: 5.97ha  Potential no of dwellings: 208</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p>

	<p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>Access to the recreational route alongside South Drove Drain is approx. 830m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 458 people (2.2 occupants in each of the 208 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.97ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk's House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.7km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop (Premier store on Pennygate). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use and there are currently no public footpaths along South Drove meaning that pedestrian travel would be potentially hazardous.</p>

	<p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (approx. 200m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Spalding Monk's House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.7km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓</p>

	<p>The development would be likely to accommodate 208 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 42 primary pupils and 40 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 1.9km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.1km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.1km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on a hedgerow – and its potential biodiversity and historic interest - along the north-eastern facing boundary. If a hedgerow is deemed to be 'important' its removal may be prohibited - Whether a hedgerow is considered to be 'important' depends on whether it meets the criteria set out in the Hedgerow Regulations 1997. Furthermore, the site is within approx. 590m of a protected site (South Drove Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and</b>	<p style="text-align: center;">x</p>

<b>Townscape</b>	<p>The site is detached from the development limits of Spalding and there are countryside views to the south and south-west. Development of the site would result in an incongruous group of dwellings in the countryside.</p> <p>The site appears to be disused with poor quality buildings and so development of the site is likely to have a positive impact on the environment, although the overall impact would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 6.94ha of predominantly grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 6.94ha of predominantly greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and the majority of the site is identified within the SFRA as 'no hazard' in terms of flood hazard and</p>

	<p>flood depth, although in some parts there is 'low hazard' and 'danger for most', with a depth of up to 1m in a very small part of the site. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>MON010: Land to the south of Horseshoe Road, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 9.98ha Potential open space: 1.40ha Development area: 8.58ha  Potential no of dwellings: 299</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>Access to the recreational route alongside South Drove Drain is approx. 140m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 658 people (2.2 occupants in each of the 299 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational</p>

	<p>facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 1.40ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk's House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 3.7km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop (Premier store on Pennygate). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use and there are currently no public footpaths along South Drove meaning that pedestrian travel would be potentially hazardous.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<b>4. Socially</b>	<p style="text-align: center;">✓/x</p>

<p><b>Inclusive Communities</b></p>	<p>ONS statistics indicate that Spalding Monk’s House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area’s services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (3.7km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 299 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 60 primary pupils and 57 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 2.9km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 4.1km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 4.1km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at</p>

	<p>secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on a hedgerow – and its potential biodiversity and historic interest - along the south-western facing boundary. If a hedgerow is deemed to be 'important' its removal may be prohibited - Whether a hedgerow is considered to be 'important' depends on whether it meets the criteria set out in the Hedgerow Regulations 1997. Furthermore, the site is within approx. 120m of a protected site (South Drove Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>Although the site adjoins some residential development to the north, the site is detached from the development limits of Spalding and there are countryside views to the south and south-west. Development of the site would result in an incongruous group of dwellings in the countryside. However, if brought forward in conjunction with surrounding sites the site's development could act as part of an extension to the built up area of the town.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 9.98ha of grade 1 and 2 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 9.98ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a combination of 'danger for some', 'low hazard' and 'no hazard' in terms of flood hazard. Flood depth varies across the site mostly from no depth up to 0.25-0.5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of</p>

	<p>the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 658 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 658 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local</p>

	<p>economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (658 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
--	---

<b>MON011: Land to the south of Horseshoe Road, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 2ha Potential open space: 0.28ha Development area: 1.72ha            Potential no of dwellings: 60</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>Access to the recreational route alongside South Drove Drain is approx. 940m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest leisure centre/playing pitch, health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 132 people (2.2 occupants in each of the 60 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.28ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p>

	<p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk’s House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.6km from the Aldi store in Spalding (St Thomas’s Road). However, the site is outside the ideal 1km walking distance from a local shop (Premier store on Pennygate). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use and there are currently no public footpaths along South Drove meaning that pedestrian travel would be potentially hazardous.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (approx. 390m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding Monk’s House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p>

	<p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.8km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 60 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 12 primary pupils and 11 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 1.8km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.9km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on a hedgerow – and its potential biodiversity and historic interest - along the south-western facing boundary. If a hedgerow is deemed to be 'important' its removal may be prohibited - Whether a hedgerow is considered to be 'important' depends on whether it meets the criteria set out in the Hedgerow Regulations 1997. Furthermore, the site is within approx. 690m of a protected site (South Drove Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p>

	<p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Spalding and there are countryside views to the south and south-west. Development of the site would result in an incongruous group of dwellings in the countryside.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>MON012: Land to the south of Horseshoe Road, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 5.7ha Potential open space: 0.80ha Development area: 4.9ha  Potential no of dwellings: 171</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will</p>

	<p>have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>Access to the recreational route alongside South Drove Drain is approx. 590m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 376 people (2.2 occupants in each of the 171 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.80ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk's House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 3.1km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop (Premier store on Pennygate). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use and there are currently no public footpaths along South Drove meaning that pedestrian travel would be potentially hazardous.</p>

	<p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Spalding Monk's House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (3.1km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓</p>

	<p>The development would be likely to accommodate 171 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 34 primary pupils and 32 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 2.3km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.4km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.5km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on some trees along the north-western facing boundary. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Furthermore, the site is within approx. 300m of a protected site (South Drove Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<p><b>7. Heritage</b></p>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<p><b>8. Landscape and Townscape</b></p>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Spalding and there are countryside views to the south and south-west. Development of the site would result in an incongruous group of dwellings in the countryside. However, if brought forward in conjunction with</p>

	<p>surrounding sites the site's development could act as part of an extension to the built up area of the town.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<p><b>9. Air, Soil and Water Resources</b></p>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 9.98ha of grade 1 and 2 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 9.98ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as danger for some in terms of flood hazard, with flood depths between 0-0.25m and 0.25-0.5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the</p>

	<p>vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<b>✓/x</b>
	<p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 376 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>

<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 376 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (376 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>MON013: Land between Bourne Road, Horseshoe Road and East Road</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 77.71ha Potential open space: 10.88ha Development area: 66.83ha  Potential no of dwellings: 2,231</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (off Kimblewick Lane) and playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 4,908 people (2.2 occupants in each of the 2231 dwellings) – would place considerable additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In</p>

	<p>the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 10.88ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase considerably with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk's House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.8km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop (Premier store on Pennygate). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the A151 and Horseshoe Road with motorists which may discourage cycle use and there are currently no public footpaths along South Drove meaning that pedestrian travel would be potentially hazardous.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding Monk's House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p>

	<p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.7km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>Development of the site might result in the loss of some allotments. There is currently a deficit of allotments in South East Lincolnshire – development of the site could have a negative impact on residents ability to access green infrastructure for recreation as identified in Objective 6 and grow food locally which may have an indirect negative impact on carbon emissions identified in Objective 12, through the generation of more food miles and trips to shops for produce. However, it is likely that development of the site would be able to accommodate allotments.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 2231 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 446 primary pupils and 424 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 2.1km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.4km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.3km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at</p>

	<p>secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site is not likely to have an adverse impact on any trees or vegetation within the site. However, the site is within approx. 730m of two protected site's (Vernatt's Drain LWS and South Drove Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - Horseshoe Bridge, a grade II listed structure is located at the southern extent of the site and Pode Hole, a grade II listed building, is located to north of the site. Existing frontage development on Bourne Road sits between the site and Pode Hole. By virtue of the scale of the site, the character of the locality as a whole would be significantly altered. The immediate setting of Pode Hole however no longer reflects its historic setting. With regard to Horseshoe Bridge, as a means of enabling movement and thereby eventually growth and development, it could be argued that the setting of a bridge in this location may be expected to change over time and to be eventually impacted on by urbanisation with the growth of Spalding as a sub-regional centre. On balance the impact on heritage assets at this location is considered minor.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Although there are largely countryside views to the west, the site is adjacent to the development limits of Spalding and its existing built-up area. The site's development could act as a natural extension to the built up area of the town. The impact upon the character of the landscape would be acceptable.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: center;">x</p>

<p><b>Water Resources</b></p>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>South Holland District Council's contaminated land register indicates that there is some unknown filled land on the site and a former railway meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 77.71ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 77.71ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and flood depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site.</p>

	<p>However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including acceptable impact upon the landscape and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 4,908 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species</p>

	and provenance are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 4,908 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (4,908 people) will generate a considerable amount of additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>MON014: Land to the north of Bourne Road, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 10.76ha Potential open space: 1.5ha Development area: 9.26ha  Potential no of dwellings: 323</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>Access to the recreational route alongside Vernatt's Drain is approx. 920m away. Furthermore, if a new access were incorporated on the north-western facing boundary this would have a positive impact on access to open space bringing Vernatts Drain within 180m of residents. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 710 people (2.2 occupants in each of the 323 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational</p>

	<p>facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 1.5ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk's House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.9km from the Aldi store in Spalding (St Thomas's Road). However, it is outside the ideal 1km walking distance from the nearest local shop (Premier store on Pennygate) meaning that residents would be less likely to use more sustainable modes of transport to meet their everyday shopping needs</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (approx. 40m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding Monk's House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents</p>

	<p>without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.8km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 323 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 65 primary pupils and 61 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Monkshouse Primary School is around 2km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.2km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.3km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p>

	Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on trees along part of the eastern boundary. Park drain also runs along this boundary. The site's development could affect the ecosystem present, by potentially affecting the water table and changing the availability of ground water, unless carefully managed surface water pollution will be a problem. Disturbance due to development can result in the movement of species, therefore undermining their sustainability. Furthermore, the site is within approx. 140m of a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. It would be necessary to create a buffer between residential development and the Drain in order to minimize the likely adverse effects.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Spalding and there are primarily open countryside views to the north. Development of the site would result in an incongruous group of dwellings in the countryside. However, if brought forward in conjunction with the sites to the east (Mon008, Mon016 and Mon020), the site's development could act as part of a natural extension to the built up area of the town.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 10.76ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 10.76ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a combination of 'danger for some', 'danger for most' and 'low hazard' in terms of flood hazard. Flood depth across the site varies from 0.25-0.5m to 1.0-2.0m, with the majority being the former. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p>

	<p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 710 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 710 people within the ideal 7km drive of local employment.</p>

	<p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (710 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
--	---

MON015: Land to the north of Bourne Road, behind Hectare House	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 0.75ha Potential open space: 0.11ha Development area: 0.64ha            Potential no of dwellings: 22</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space and playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 48 people (2.2 occupants in each of the 22 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area,</p>

	<p>about 0.11ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The site is also adjacent to an existing employment use which may have an impact on the amenities that would be enjoyed by the residents of new dwellings. Consequently, structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk’s House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.8km from the Aldi store in Spalding (St Thomas’s Road). However, it is outside the ideal 1km walking distance from the nearest local shop (Premier store on Pennygate) meaning that residents would be less likely to use more sustainable modes of transport to meet their everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (approx. 140m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding Monk’s House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for</p>

	<p>residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.8km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 22 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 4 primary pupils and 4 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Monkshouse Primary School is around 1.9km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.2km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.2km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on mature trees and hedging along all boundaries. However, due to the size of the site there is limited scope through which to minimize these impacts, although it may be possible to retain trees along the western boundary in order to help mitigate the effects of the site's close proximity to the existing employment use to the west. The site is also within approx. 260m of a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p>

	<p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is detached from the development limits of Spalding and there are primarily open countryside views to the north. However, the site is bordered by an existing employment use the west and the A151 to the south meaning that development is not likely to have an adverse impact on the character and appearance of the landscape.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓/x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>However this site does secure the redevelopment of some previously-developed land (around half of the site) which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use</b>	<p style="text-align: center;">✓/x</p>

<p><b>of Land and Waste</b></p>	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of some previously-developed land (around half of the site) which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard. Flood depths for the majority of the site are either 1.0-2.0 or 0.5-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<p><b>12. Climate Change</b></p>	<p style="text-align: center;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 48 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<p><b>13. Economy and Employment</b></p>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new</p>

	<p>development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 48 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (48 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
--	--

MON016: Land to the north of Bourne Road, Spalding	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 8.03ha Potential open space: 1.12ha Development area: 6.91ha            Potential no of dwellings: 241</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>Access to the recreational route alongside Vernatt's Drain is approx. 380m away. Furthermore, if a new access were incorporated on the north-western facing boundary this would have a positive impact on access to open space bringing Vernatts Drain within 180m of residents. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 530 people (2.2 occupants in each of the 24 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed</p>

	<p>with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 1.12ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk's House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.9km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop (Premier store on Pennygate). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the A151 with motorists which may discourage cycle use.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (approx. 110m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding Monk's House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside</p>

	<p>other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.8km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 241 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 48 primary pupils and 46 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Monkshouse Primary School is around 1.9km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.2km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.3km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity,</b></p>	<p style="text-align: center;">✓/x</p>

<b>Geodiversity and Green Infrastructure</b>	<p>Development of the site may have an adverse impact on trees along the eastern boundary. To determine the value of these trees for wildlife they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining as many trees as possible and maximising opportunities for enhancement and mitigation. Park drain also runs along this boundary. Disturbance due to development can result in the movement of species, therefore undermining their sustainability. Mitigation may be required to offset any potential harm identified but this will depend upon implementation.</p> <p>Furthermore, the site is within approx. 140m of a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. It would be necessary to create a buffer between residential development and the Drain in order to minimize the likely adverse effects.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Spalding and there are primarily open countryside views to the north. Development of the site would result in an incongruous group of dwellings in the countryside. However, if brought forward in conjunction with the sites to the east (Mon008 and Mon020), the site's development could act as part of a natural extension to the built up area of the town.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-</p>

	<p>off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 8.03ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 8.03ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and the majority is identified within the SFRA as ‘danger for most’ in terms of flood hazard, with some parts being ‘danger for some’ and low/no hazard. Flood depths vary across the site between 0-0.5m to 1.0-2.0m, but most of the site has depths of 0.5-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the</p>

	<p>design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 530 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 530 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (530 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable</p>

	sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.
--	--

<b>MON017: Land to the north of Bourne Road, Pode Hole</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 1.25ha Potential open space: 0.18ha Development area: 1.07ha Potential no of dwellings: 38
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.  The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.  However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.
<b>2. Health and Well-being</b>	x
	Access to the recreational route alongside Vernatt's Drain is approx. 680m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.  It is anticipated that the increase in population - approximately 84 people (2.2 occupants in each of the 38 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.  The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.  Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.18ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.  Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The site is also in close proximity to the proposed route of the Spalding Western Relief Road and is adjacent to Lincolnshire County Council's Highways depot

	<p>which may have an impact on the amenities that would be enjoyed by the residents of new dwellings. Consequently, structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk’s House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 3km from the Aldi store in Spalding (St Thomas’s Road). However, it is outside the ideal 1km walking distance from the nearest local shop (Premier store on Pennygate) meaning that residents would be less likely to use more sustainable modes of transport to meet their everyday shopping needs</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding Monk’s House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area’s services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.9km) are within the ideal 7km drive of</p>

	<p>the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 38 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 8 primary pupils and 7 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Monkshouse Primary School is around 2km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on hedging along part of the eastern boundary. However, due to the size of the site it is likely that any such impacts could be minimized by careful layout. The site is also within approx. 140m of a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p>

	<p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is detached from the development limits of Spalding and there are primarily open countryside views to the north. However, the site is bordered by frontage development and there is residential development opposite. There is also an employment use adjacent to the site to the east and Lincolnshire County Council's Highways depot to the west. Consequently, the site's development is not likely to adversely alter the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 1.25ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.25ha of greenfield land.</p>

	This site is not within a Mineral Safeguarding Area.
<b>11. Flood Risk</b>	<p style="text-align: right;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as danger for most in terms of flood hazard, with flood depths between 0.5m – 1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: right;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 84 people would generate new car journeys and hence carbon emissions.</p>

	<p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 84 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (84 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>MON018: Land off Monks House Lane, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 1.23ha Potential open space: 0.17ha Development area: 1.06ha  Potential no of dwellings: 25</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-</b>	✓/x

<p><b>being</b></p>	<p>The nearest open space is located off Roeburn Way around 310m from the site and Monks House Lane Playing Field is around 790m away. If an access were incorporated on the north-western facing boundary this would have a positive impact on access to open space bringing Vernatts Drain within 80m of residents. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are both outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 55 people (2.2 occupants in each of the 25 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.17ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. Consequently, structural landscaping such as trees of mixed provenance may be necessary along the adjoining boundaries to help mitigate any noise and air pollution.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk's House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.4km from the Aldi store in Spalding (St Thomas's Road). However, the site is just outside the ideal 1km walking distance from a local shop being 1.1km from the Co-operative store off Clover Way. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p>

	<p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (approx. 100m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding Monk's House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.4km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the times of the first and last buses to/from Spalding town centre do not fit in particularly well with the average working day.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p>

	<p>The development would be likely to accommodate 25 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 5 primary pupils and 5 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Wygate Park Academy is around 710m from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.7km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.8km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>Development of the site is not likely to have an adverse impact on any trees or vegetation. However, the site is within approx. 50m of a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. It would be necessary to create a buffer between residential development and the Drain in order to minimize the likely adverse effects.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<p><b>7. Heritage</b></p>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<p><b>8. Landscape and Townscape</b></p>	<p style="text-align: center;">✓</p> <p>The site is adjacent to the development limits of Spalding and its existing built-up area. Development of the site is not likely to have an</p>

	<p>adverse impact on the character and appearance of the landscape.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 1.23ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.23ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as a combination of 'danger for most', 'danger for some' and 'no/low hazard' in terms of flood hazard. Flood depths vary across the site from no depth to 1-2.0m, but the greatest part of the site is 0.5-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p>

	<p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 55 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p>

	The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓/x
	The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 55 people within the ideal 7km drive of local employment.
	Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).
	The increased population (55 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.

<b>MON019: 366 Bourne Road, Pode Hole</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 1.34ha Potential open space: 0.19ha Development area: 1.15ha Potential no of dwellings: 40
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.
	The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.
	However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.
<b>2. Health and Well-being</b>	x
	Access to the recreational route alongside Vernatt's Drain is approx. 380m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.
	It is anticipated that the increase in population - approximately 88 people (2.2 occupants in each of the 40 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.

	<p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.19ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The site is also in close proximity to the proposed route of the Spalding Western Relief Road. Consequently, structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk's House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 3.1km from the Aldi store in Spalding (St Thomas's Road). However, it is outside the ideal 1km walking distance from the nearest local shop (Premier store on Pennygate) meaning that residents would be less likely to use more sustainable modes of transport to meet their everyday shopping needs</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity (120m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding Monk's House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p>

	<p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (3.1km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 40 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 8 primary pupils and 8 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Monkshouse Primary School is around 2.2km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.5km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.5km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of</p>

	the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on a number of mature trees within the site. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Furthermore, the site is within approx. 70m of a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. It would be necessary to create a buffer between residential development and the Drain in order to minimize the likely adverse effects. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>The site abuts the eastern boundary of the curtilage of a grade II listed building (Pode Hole). The site will be visible from within Mon019. The immediate setting of Pode Hole however no longer reflects its historic setting and is not therefore a key component of its significance in the modern day.</p> <p>On balance the impact on the heritage asset at this location is considered minor.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is detached from the development limits of Spalding. However, the site does not have a countryside character as it is bounded by development to the west and residential development fronting the A151 Bourne Road is to the south. Consequently, the site's development is not likely to adversely alter the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction</p>

	<p>could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 1.34ha of grade 1 agricultural/horticultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;"><b>x</b></p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.34ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;"><b>✓/x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a combination of ‘danger for some’ and ‘danger for most’. Flood depths on the site vary mostly from 0.25-0.5m to 0.5-1.0m, with the greater proportion being the former. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including not likely having an adverse impact on the character of the area and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p>

	<p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 88 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 88 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (88 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>MON020: Land to the west of Monks House Lane, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 28ha Potential open space: 4ha Development area: 24ha  Potential no of dwellings: 840</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓/x</p> <p>The nearest open space is located off Roeburn Way around 390m from the site and Monks House Lane Playing Field is around 660m away. If a new access were incorporated on the north-western facing boundary this would have a positive impact on access to open space bringing Vernatts Drain within 190m of residents. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are both outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 1848 people (2.2 occupants in each of the 840 dwellings) – would place considerable additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 4ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase considerably with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale offers</p>

	opportunities to mitigate such impacts effectively.
<b>3. Transport</b>	x
	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk’s House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.3km from the Aldi store in Spalding (St Thomas’s Road). However, the site is outside the ideal 1km walking distance from a local shop being 1.3km from the Premier Store on Pennygate. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (approx. 100m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	✓/x
	<p>ONS statistics indicate that Spalding Monk’s House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area’s services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p>

	<p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (2.3km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the times of the first and last buses to/from Spalding town centre do not fit in particularly well with the average working day.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	✓
	<p>The development would be likely to accommodate 840 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 168 primary pupils and 160 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Wygate Park Academy is around 770m from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.6km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.6km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	✓/x
	<p>Development of the site is not likely to have an adverse impact on any trees or vegetation. However, the site is within approx. 40m of a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. It would be necessary to create a buffer between residential development and the Drain in order to minimize the likely adverse effects.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	0
	Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be

	<p>affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Although there are primarily open countryside views to the west, the site is adjacent to the development limits of Spalding and its existing built-up area. Development of the site is not likely to have an adverse impact on the character and appearance of the landscape. The site's development (potentially alongside Mon008) could act as a natural extension to the built up area of the town.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 28ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p>

	<p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 28ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a combination of ‘no hazard’, ‘low hazard’, ‘danger for some’ and ‘danger for most’ in terms of flood hazard, with the majority being either no/low hazard. Flood depth varies across the site from 0-0.25m to 1.0-2.0m, although most of the site is the former. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including not likely having an adverse impact on the character of the area and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	✓/x

	<p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 1,848 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<p><b>13. Economy and Employment</b></p>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 1,848 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (1,848 people) will generate a considerable amount of additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>MON021: Land at Horseshoe Bridge, Horseshoe Road, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 1.47ha Potential open space: 0.21ha Development area: 1.26ha Potential no of dwellings: 44
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>Access to the recreational route alongside South Drove Drain is approx. 140m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk's House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert's Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 97 people (2.2 occupants in each of the 44 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.21ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. Consequently, structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution.</p>
<b>3. Transport</b>	x

	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk’s House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 3.3km from the Aldi store in Spalding (St Thomas’s Road). However, the site is outside the ideal 1km walking distance from a local shop (Premier store on Pennygate). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use and there are currently no public footpaths along South Drove meaning that pedestrian travel would be potentially hazardous.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in proximity (approx. 180m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Spalding Monk’s House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area’s services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (3.3km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is not particularly</p>

	<p>accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 44 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 9 primary pupils and 8 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 2.5km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.7km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.7km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on some mature trees along the south-eastern facing boundary. To determine the value of these trees for wildlife, they should be subject to a quality assessment.</p> <p>Furthermore, the site is within approx. 40m of a protected site (South Drove Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required</p>

	<p>dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>Although the site adjoins some residential development to the north, the site is detached from the development limits of Spalding and there are countryside views to the south and south-west. Development of the site would result in an incongruous group of dwellings in the countryside. However, if brought forward in conjunction with surrounding sites the site's development could act as part of an extension to the built up area of the town.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 1.47ha of grade 2 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.47ha of greenfield land.</p>

	This site is not within a Mineral Safeguarding Area.
<b>11. Flood Risk</b>	✓
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a combination of 'low hazard', 'no hazard', 'danger for most' and 'danger for some' in terms of flood hazard, with the majority being either no/low hazard. Flood depth varies across the site from no depth to 1.0-2.0m, although the majority is 0-0.25m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including not likely having an adverse impact on the character of the area and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	✓/x
	<p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 97 people would generate new car journeys and hence carbon</p>

	<p>emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 97 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (97 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>MON023: Land to the south of Horseshoe Road, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 8.67ha Potential open space: 1.21ha Development area: 7.46ha  Potential no of dwellings: 260</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>

<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>Access to the recreational route alongside South Drove Drain is approx. 850m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (Monk’s House Playing Field), health centre (Pennygate Health Centre) and community centre (St Norbert’s Community Hall) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 572 people (2.2 occupants in each of the 260 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents. The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP’s, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP’s, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding Monkshouse does not have enough open space to meet its resident’s needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 1.21ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding Monk’s House) showed that 85.7% of households owned at least one car and 50.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 3.2km from the Aldi store in Spalding (St Thomas’s Road). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the site is outside the ideal 1km walking distance from the nearest local shop (Premier store on Pennygate). Furthermore, bicycles would have to share the existing highway network with motorists which may discourage cycle use and</p>

	<p>there are currently no public footpaths along South Drove meaning that pedestrian travel would be potentially hazardous.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Spalding Monk's House is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (13.2% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (14.3% compared to 18%) and that crime rate per 1000 is also well below the county average at 28.2 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (3.2km) are within the ideal 7km drive of the site. However, it is well outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the nearest bus stop for buses into Spalding Town Centre is unlikely to be accessible by foot.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓</p>

	<p>The development would be likely to accommodate 260 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 52 primary pupils and 49 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 2.2km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.5km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>Part of the site falls within a SSSI Impact Risk Zone. Upon receiving any planning application to develop the site for 100 dwellings or more, the local planning authority must consult Natural England for advice on how impacts might be avoided or mitigated.</p> <p>In order to achieve a suitable access to the site, development would likely result in the loss of some mature trees along the north-western boundary. To determine the value of these trees for wildlife, they should be subject to a quality assessment.</p> <p>Furthermore, the site is in close proximity to a protected site being approx. 220m from the South Drove Drain LWS. There is the potential for increased residential development in this area to have an impact upon the biodiversity of this LWS due to increased footfall along the drain through greater recreational use.</p> <p>Development of the site may also have an adverse impact on any wildlife and habitats within Hill's Drain which runs along the south-eastern boundary of the site. Disturbance due to development can result in the movement of species, therefore undermining their sustainability. Mitigation may be required to offset any potential harm identified but this will depend upon implementation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<p><b>7. Heritage</b></p>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<p><b>8. Landscape and Townscape</b></p>	<p style="text-align: center;">x</p> <p>Development of the site would have an adverse impact on the character and appearance of the landscape. The site is detached from the</p>

	<p>development limits of Spalding and there are countryside views to the south and south-west. The site's development would result in an incongruous group of dwellings in the countryside that are unrelated to the existing town. However, if brought forward in conjunction with surrounding sites the site's development could act as part of an extension to the built up area of the town.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<p><b>9. Air, Soil and Water Resources</b></p>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 8.67ha of grade 1 and 2 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 8.67ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a combination of 'low hazard', 'no hazard', 'danger for some' and 'danger for most' in terms of flood hazard. Flood depths vary across the site from no depth to 1.0-2.0m, with most of the site being either 0-0.25m or no depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within</p>

	<p>the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including acceptable impact upon the landscape and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	✓/x
	<p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 572 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p>

	The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓/x
	The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 572 people within the ideal 7km drive of local employment.
	Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).
	The increased population (572 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.

<b>PIN001: Land between Spalding and Pinchbeck</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 39.5ha Potential open space: 5.53ha Development area: 33.97ha Potential no of dwellings: 1,185
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.
	The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.
	Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.
<b>2. Health and Well-being</b>	x
	The nearest medical facility is the Johnson Community Hospital approx. 670m from the site. However, the majority of the facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The closest open space (near Mill Green Level Crossing) and playing field (off Rotten Row) are approx. 1.2km and 2km from the site respectively. Pinchbeck Village Hall is approx. 1.9km from the site.
	It is anticipated that the increase in population – approximately 2,607 people (2.2 occupants in each of the 1,185 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.

	<p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Pinchbeck and Surfleet ward does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area, about 5.53ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the railway line borders some of the south-western boundary and also runs through part of the site. This line is likely to experience increased traffic in light of the recent upgrade to the line and potential future Rail Freight Interchange at Deeping Fen. Structural landscaping such as trees of mixed provenance, may be necessary to help mitigate any noise and air pollution as well as helping to minimise the visual impact generated through proximity to the rail network.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is within the ideal short driving (7km) distance to a big supermarket being around 1.6km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site. Large scale development such as this site can provide improved footpath, cycle and public transport links.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Buses run along Spalding Road to Spalding and Boston throughout the day but the nearest stop is outside the ideal 400m walking distance.</p>

<b>4. Socially Inclusive Communities</b>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet ward is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. However, as discussed in Objective 13, the nearest employment opportunities at Wardentree Lane (470m) are within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: right;">✓</p> <p>The development would be likely to accommodate 1,185 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 237 primary pupils and 225 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Pinchbeck East Church of England Primary School approx. 2.1km away</li> <li>• Spalding Grammar School is approx. 2.9km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p>

	Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site abuts a protected site (Vernatt's Drain LWS) on its southern facing boundary and Blue Gowt Drain also borders and runs through part of the site. As a result, development may have an effect on habitats and BAP species and consequently biodiversity. It may be necessary to create some form of buffer between residential development and these drains in order to minimize any potential adverse effects.</p> <p>There are also mature trees located within the site that may be affected by development. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site could have adverse impacts on the Grade II listed Yew Tree Farmhouse located to the south of the site. However, any such impacts could be prevented by careful design.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>Although the site is adjacent to defined settlement limits its development would undermine the separate identities of Pinchbeck and Spalding. The impact on the visual amenity of neighbours would be significant if the whole site was developed and it would completely change the character of the area. The railway line – which currently acts as the perceived end to the built up area in the west - may be a more appropriate boundary, thereby preventing development to the west of it.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p>

	<p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>South Holland District Council's contaminated land register indicates that there is some filled land near the site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>Water mains and sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 39.5ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 39.5ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as a combination of 'danger for most', 'danger for some' and 'low hazard' in terms of flood hazard. Flood depths vary across the site from 0-0.25m to 0.5-1.0m, although most of the site is 0.25-0.5m and 0.5-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p>

	<p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<b>✓/x</b>
	<p>As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 2,607 people would generate a considerable number of new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<b>✓/x</b>
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 2,607 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local</p>

	<p>economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (2,607 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
--	---

<b>PIN011: Land to the south of Wardentree Lane, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 5.05ha Potential open space: 0.71ha Development area: 4.34ha  Potential no of dwellings: 152</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">XX</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest amenity open space is located off Burma Avenue around 1.2km away whilst the closest playing field (off Guildhall Drive) is approx. 1.9km from the site. The Johnson Community Hospital and Pinchbeck Village Hall are 1.3km and 1.7km away from the site respectively.</p> <p>It is anticipated that the increase in population – approximately 334 people (2.2 occupants in each of the 152 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Pinchbeck and Surfleet ward does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.71ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p>

	<p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is located off the road that serves the Wardentree Lane industrial area and is close to offices and a storage/distribution use. This may have an impact on the amenities that would be enjoyed by the residents of new dwellings. Industrial impact on residential development can be addressed by dwelling choice, layout and the use of open space. Additionally, structural landscaping such as trees of mixed provenance may be used to help mitigate any noise and air pollution.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 870m from the Morrisons Store in Pinchbeck (Wardentree Lane). This means that the site is also within the ideal 1km walking distance of a local shop/supermarket. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (220m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. Buses run along Spalding Road to Spalding and Boston throughout the day but the nearest stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p>

	<p>Some of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. However, as discussed in Objective 13, the nearest employment opportunities at Wardentree Lane (400m) are within the both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 152 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 30 primary pupils and 29 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Pinchbeck East Church of England Primary School is around 1.7km from the site</li> <li>• Spalding Grammar School is approx. 3.5km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>There are trees along the southern boundary that may be adversely affected by development of the site. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>Furthermore, the site is approx. 630m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>

<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – Some archaeological work has already been undertaken on this site and more may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is adjacent to the existing built-up area (defined settlement limit) and currently acts as a buffer between residential development on Spalding Road and Wardentree Lane and the industrial development on Enterprise Way. Developing the site would remove this barrier, bringing residential development up to the industrial area. This would have an unacceptable impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 5.05ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p>

	<p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 5.05ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as a combination of ‘danger for some’, ‘danger for most’, ‘low hazard’ and ‘no hazard’ in terms of flood hazard. Flood depths vary across the site, but the majority is 0.25-0.5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>

<b>12. Climate Change</b>	<p style="text-align: right;">✓/x</p> <p>As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 334 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: right;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 334 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (334 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>PIN013: Land to the east of Spalding Road, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.28ha Potential no of dwellings: 8
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The Johnson Community Hospital is approx. 440m away. However, the nearest open space (off Burma Avenue) is just over 1km from the site and Pinchbeck's playing field (off Guildhall Drive) is around 1.7km away. Pinchbeck Village Hall is approx. 1.5km from the site.</p> <p>It is anticipated that the increase in population – approximately 18 people (2.2 occupants in each of the 8 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	✓/x
	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 1.4km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, it is outside the ideal 1km walking distance. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and</p>

	<p>safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (180m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. The nearest bus stops around 330m from the site on Spalding Road, within the ideal 400m walking distance. Buses run to Spalding and Boston throughout the day.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). However, as discussed in Objective 13, the nearest employment opportunities at Enterprise Park (230m) are well within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 8 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 2 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p>

	<ul style="list-style-type: none"> <li>• Pinchbeck East Church of England Primary School is around 1.6km from the site</li> <li>• Spalding Grammar School is approx. 2.6km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.1km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site (approx. 490m from Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. There are also some trees bordering the site. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is adjacent to the development limits of Pinchbeck/Spalding and is bounded by development to the south and west. It is located behind frontage development, reducing its visibility. Consequently, development of the site is not likely to have an adverse impact on the character and appearance of the landscape. Furthermore, planning permission has recently been granted for 169 dwellings on land to the north and east of the site. If this permission is implemented, the development of Pin013 would round off this area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>Development of the site would result in the loss of approx 0.28ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as 'danger for some' in terms of flood hazard, with flood depths between 0-0.25m and 0.25m – 0.5m, with much of the site being the latter. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p>

	<p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<b>✓/x</b>
	<p>As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 18 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<b>✓/x</b>
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 18 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local</p>

	economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).
--	--

<b>PIN016: Land to the west of Spalding Road, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 1.98ha Potential open space: 0.28ha Development area: 1.7ha Potential no of dwellings: 59
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.  The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.  Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.
<b>2. Health and Well-being</b>	x
	The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The Johnson Community Hospital is approx. 690m from the site. However, the nearest open space (off Burma Avenue) is just over 1km away and Pinchbeck's playing field (off Guildhall Drive) is approx. 1.7km from the site. Pinchbeck Village Hall is around 1.5km away.  It is anticipated that the increase in population – approximately 130 people (2.2 occupants in each of the 59 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.  The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.  Overall, Pinchbeck and Surfleet ward does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area, about 0.28ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.  Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.
<b>3. Transport</b>	✓/x

	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 1.6km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (150m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. The nearest bus stops around 330m from the site on Spalding Road, within the ideal 400m walking distance. Buses run to Spalding and Boston throughout the day.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services and facilities are outside the ideal walking distances which may have an adverse impact on social inclusion. However, as discussed in Objective 13, the nearest employment opportunities at Enterprise Park (490m) are within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	No infrastructure will be lost on site as a consequence of this proposal.
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 59 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 12 primary pupils and 11 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Pinchbeck East Church of England Primary School is around 1.6km from the site</li> <li>• Spalding Grammar School is approx. 2.9km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is approx. 460m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is adjacent to the development limits of Pinchbeck/Spalding and has residential development to the east. The site should be developed in conjunction with other sites that have been put forward between Spalding Road, Vernatts Drain, the railway and Market</p>

	<p>Way in order to facilitate the development of the Spalding Western Relief Road as well as to help provide improved footpath, cycle and public transport links. The impacts on the visual amenity of neighbours would be acceptable.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<p><b>9. Air, Soil and Water Resources</b></p>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 1.98ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.98ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and most of it is identified within the SFRA as 'danger for most' in terms of flood hazard, with some parts being 'danger for some' and 'low hazard'. Flood depths vary across the site from 0-0.25m to 0.5-1.0m, with much of the site being 0.25-0.5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p>

	<p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 130 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p>

	The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 130 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (130 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>PIN020: Land to the west of Spalding Road, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 2.99ha Potential open space: 0.42ha Development area: 2.57ha Potential no of dwellings: 90
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓/x
	<p>Some of the facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (off Burma Avenue) and the Johnson Community Hospital are located around 800m and 850m from the site respectively. However, other facilities are outside the ideal walking distance as the closest playing field (off Guildhall Drive) is approx. 1.4km away and Pinchbeck Village Hall is around 1.3km from the site.</p> <p>It is anticipated that the increase in population – approximately 198 people (2.2 occupants in each of the 90 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p>

	<p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 90 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 18 primary pupils and 17 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Pinchbeck East Church of England Primary School is around 1.3km from the site</li> <li>• Spalding Grammar School is approx. 3km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.5km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>The site is approx. 630m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p>

	<p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>The site and surrounding area is not known to have any significant historic or culturally-significant features.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is adjacent to the development limits of Pinchbeck/Spalding and has residential development to the east. The site should be developed in conjunction with other sites that have been put forward between Spalding Road, Vernatts Drain, the railway and Market Way in order to facilitate the development of the Spalding Western Relief Road as well as to help provide improved footpath, cycle and public transport links.</p> <p>The impacts on the visual amenity of neighbours would be acceptable.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 2.99ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p>

	<p>The proposal would lead to the permanent loss of approx. 2.99ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: right;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with the majority of the site having flood depths between 0.5m – 1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: right;">✓/x</p> <p>As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 198 people would generate new car journeys and hence carbon emissions.</p>

	<p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 198 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (198 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

PIN026: Land to the east of Tydd Road, Spalding	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 31.28ha Potential open space: 4.38ha Development area: 23.9ha  Potential no of dwellings: 938</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-</b>	x

<p><b>being</b></p>	<p>The majority of the facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (off Kelly Close) and playing field (off Rotten Row), health centre (The Surgery in Pinchbeck) and Pinchbeck Village Hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population – approximately 2,064 people (2.2 occupants in each of the 938 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Pinchbeck and Surfleet ward does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area, about 4.38ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is within the ideal short driving (7km) distance to a big supermarket being around 5.7km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the relatively isolated nature of the site may deter residents from walking or cycling to reach facilities and services.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (690m approx. from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p>

	<p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is well outside the ideal 400m walking distance.</p> <p>The roads around this part of Pinchbeck/Spalding are narrow rural lanes and so improvements are likely to be required to accommodate the traffic that will be generated by development of the site.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. However, if the site were to be developed in conjunction with Pin024, a development of this scale would be capable of providing its own services and facilities and would have the potential to provide new crossings of the railway line and Vernatt's Drain. A large scale development can also provide improved footpath, cycle and public transport links.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (5.1km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the site is relatively isolated.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 938 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 188 primary pupils and 178 secondary pupils. However, all primary and secondary schools and post 18 education providers are outside the ideal walking distance.</p>

	<p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Blue Gowt Drain runs along the site's southern boundary and so development may have an effect on habitats and BAP species and consequently biodiversity. It may be necessary to create some form of buffer between residential development and the Drain in order to minimize any potential adverse effects. There are also some trees within the site that may be affected by development. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓/x</p> <p>The site is detached from defined settlement limits and has a poor relationship with the existing built up area. Its development would create a large incongruous group of dwellings in the countryside which would have an impact on the character and appearance of the landscape. However, Wygate Park is visible from the site and so the area's character is beginning to change with the development of Spalding on the horizon.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: center;">x</p>

<p><b>Water Resources</b></p>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 31.28ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 31.28ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as combination of 'no hazard', 'danger for most', 'low hazard', 'danger for some', 'danger for most' and 'danger for all' in terms of flood hazard. Flood depths vary across the site between no depth to 1.0-2.0m, although most of the site is below 0.5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk</p>

	<p>overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 2,064 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. --	--

PIN031: Land to the west of Spalding Road, Spalding	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 3.04ha Potential open space: 0.43ha Development area: 2.61ha            Potential no of dwellings: 91</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓/x
	<p>Some of the facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The Johnson Community Hospital is approx. 160m from the site and the nearest open space (near Mill Green level crossing) around 710m away. However, some of the other facilities are outside of the ideal walking distance. The closest leisure centre (Castle Sports Complex) and Pinchbeck Village Hall are approx. 1.4km and 1.8km from the site respectively.</p> <p>It is anticipated that the increase in population – approximately 200 people (2.2 occupants in each of the 91 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p>

	<p>Overall, Pinchbeck and Surfleet ward does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area, about 0.43ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 1.4km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. The site should be developed in conjunction with other sites that have been put forward between Spalding Road, Vernatts Drain, the railway and Market Way in order to facilitate the development of the Spalding Western Relief Road as well as to help provide improved footpath, cycle and public transport links.</p> <p>The site is in extremely close proximity to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Buses run along Pinchbeck Road to Spalding and Boston throughout the day but the nearest stop is outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside</p>

	<p>other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. However, as discussed in Objective 13, the nearest employment opportunities at Enterprise Park (220m) are within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 91 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 18 primary pupils and 17 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Pinchbeck East Church of England Primary School is around 1.9km from the site</li> <li>• Spalding Grammar School is approx. 2.3km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 1.8km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>The site is approx. 150m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p>

	<p>There are also trees along the eastern boundary which may have value for wildlife (a quality assessment can determine this). Development may have an adverse impact on them. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	x
	<p>Built heritage assets (including Historic Parks and Gardens) – The significance of the site is in its contribution to the agricultural setting of Yew Tree Farmhouse (a Grade II listed farmhouse). The site is part of an extensive open frontage along Pinchbeck Road going north from Yew Tree Farmhouse. The development of the site would impact directly on the historic setting of Yew Tree Farmhouse due to its proximity and so would constitute harm to its significance. Development of the Spalding Western Relief Road will, however, provide a potential limit to development southwards which would go some way to addressing the potential impact.</p> <p>Potential mitigation – none; Potential enhancement – none.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	✓
	<p>The site is adjacent to the development limits of Spalding and is located behind some trees that line the eastern boundary and help to screen the site. There is also development on the opposite site of Spalding Road. The impacts on the visual amenity of neighbours would be acceptable.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	x
	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p>

	<p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 3.04ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 3.04ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as a combination of 'danger for most', 'danger for some' and 'low hazard'. Flood depths vary across the site between 0-0.25m and 0.5-1.0m, with the greatest proportion being 0.25-0.5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed</p>

	<p>proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 200 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 200 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (200 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is</p>

	detrimental to the economy.
--	-----------------------------

<b>PIN040: Land to the south of Market Way, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 1.05ha Potential open space: 0.15ha Development area: 0.9ha Potential no of dwellings: 32
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.  The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.  Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓/x
	Some of the facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (off Burma Avenue) and the Johnson Community Hospital are located around 660m and 860m from the site respectively. However, the closest playing field (off Guildhall Drive) and Pinchbeck Village Hall are both outside the ideal walking distances.  It is anticipated that the increase in population – approximately 70 people (2.2 occupants in each of the 32 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.  The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.  Overall, Pinchbeck and Surfleet does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area, about 0.15ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.  Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.
<b>3. Transport</b>	✓/x

	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 1.2km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. The site should be developed in conjunction with other sites that have been put forward between Spalding Road, Vernatts Drain, the railway and Market Way in order to facilitate the development of the Spalding Western Relief Road as well as to help provide improved footpath, cycle and public transport links.</p> <p>The site is in close proximity (470m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. The nearest bus stops around 180m from the site on Spalding Road near the junction with Wardentree Lane, within the ideal 400m walking distance. Buses run to Spalding and Boston throughout the day.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services and facilities are outside the ideal walking distances which may have an adverse impact on social inclusion. However, as discussed in Objective 13, the nearest employment opportunities at Wardentree Lane (600m) are within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p>

	<p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 32 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 6 primary pupils and 6 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Pinchbeck East Church of England Primary School is around 1.2km from the site</li> <li>• Spalding Grammar School is approx. 3km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.5km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is approx. 750m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There are also trees along all boundaries which may have value for wildlife (a quality assessment can determine this). Development may have an adverse impact on them. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>Furthermore, Blue Gowt Drain runs along the northern boundary of the site. Disturbance due to development can result in the movement of species, therefore undermining their sustainability. Mitigation may be required to offset any potential harm identified but this will depend upon implementation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	0

	<p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Development of the site would not greatly alter the character and appearance of the area. The site is adjacent to the development limits of Pinchbeck/Spalding and is mostly located behind residential development on Spalding Road. Trees also help to screen the site to the north which would help minimise its visual impacts. The impacts on the visual amenity of neighbours would be acceptable.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 1.05ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p>

	<p>The proposal would lead to the permanent loss of approx. 1.05ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: right;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as a combination of 'danger for most' and 'danger for some' in terms of flood hazard. Flood depths vary on the site mostly between 0.25-0.5m and 0.5-1.0m, with much of the site being the latter. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. <b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 70 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (70 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

PIN051: Farm Yard, Blue Gowt Drove, Spalding	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.24ha Potential no of dwellings: 5
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>

<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>The majority of the facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (adjacent Mill Green level crossing) and playing field (off Rotten Row), the Johnson Community Hospital and Pinchbeck Village Hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population – approximately 11 people (2.2 occupants in each of the 5 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.5km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all. If the site were to be developed in conjunction with Pin024, a development of this scale would provide its own services and facilities and would have the potential to provide new crossings of the railway line and Vernatt's Drain. A large scale development can also provide improved footpath, cycle and public transport links.</p> <p>The site is in close proximity (320m approx. from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p>

	<p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (2km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that there are no footpaths from the site and cyclists would have to share the existing road network. This may deter residents from using these sustainable modes of travel.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 5 dwellings. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Primary School is around 1.2km from the site</li> <li>• Spalding Grammar School is approx. 3km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.5km away at the Red Lion Quarter.</p>

	<p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents, particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is approx. 40m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. Furthermore, the site is bordered by trees on the north-western and south-eastern facing boundaries which may have value for wildlife (a quality assessment can determine this). Development may have an adverse impact on them. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from defined settlement limits and has a poor relationship with the existing built up area. Its development would create an incongruous group of dwellings in the countryside which would have an adverse impact on the character and appearance of the landscape.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction</p>

	<p>could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 0.24ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	x
	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.24ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	✓
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including improving education and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity,</p>

	<p>thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	✓/x
	<p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. However it is likely that the anticipated increase in 11 people would only generate a limited number of new car journeys and associated carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 11 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p>
<b>PIN052: Land to the east of Tydd Road, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 4.98ha Potential open space: 0.70ha Development area: 4.28ha  Potential no of dwellings: 149</p>
<b>1. Housing</b>	✓

	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>The majority of the facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space and playing field (Monk's House Playing Field), health centre (The Surgery in Pinchbeck) and Pinchbeck Village Hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population – approximately 328 people (2.2 occupants in each of the 149 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Pinchbeck and Surfleet does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area, about 0.70ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is within the ideal short driving (7km) distance to a big supermarket being around 5km from the Aldi Store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the relatively isolated nature of the site may deter residents from walking or cycling to reach facilities and services. If the site were to be developed in conjunction with</p>

	<p>Pin024, a development of this scale would provide its own services and facilities and would have the potential to provide new crossings of the railway line and Vernatt's Drain. A large scale development can also provide improved footpath, cycle and public transport links.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in extremely close proximity to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is outside the ideal 400m walking distance.</p> <p>The roads around this part of Pinchbeck/Spalding are narrow rural lanes and so improvements are likely to be required to accommodate the traffic that will be generated by development of the site.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities in Spalding Town Centre (5km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the site is relatively isolated. There are also no footpaths from the site and cyclists would have to share the existing road network which may deter residents from using these sustainable modes of travel.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	No infrastructure will be lost on site as a consequence of this proposal.
<b>5. Education</b>	x
	<p>The development would be likely to accommodate 149 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 30 primary pupils and 28 secondary pupils. However, all primary and secondary schools and post 18 education providers are outside the ideal walking distance.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's, particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	√/x
	<p>The south eastern facing boundary of the site is adjacent to a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. It may be necessary to create a buffer between residential development and the Drain in order to minimize the likely adverse effects.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	0
	<p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	x
	The site is detached from defined settlement limits and has a poor relationship with the existing built up area. Its development would create an incongruous group of dwellings in the countryside which would have an adverse impact on the character and appearance of the landscape.

	The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.
<b>9. Air, Soil and Water Resources</b>	x
	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 4.98ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	x
	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 4.98ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	✓
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a combination of 'low hazard' and 'danger for some' in terms of flood hazard. Flood depths across the majority of the site and between no depth and 0-0.25m, with much of the site being 0-0.25m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed,</p>

	<p>it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 328 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and</b>	<p style="text-align: center;">✓/x</p>

<b>Employment</b>	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 328 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (328 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
-------------------	--

<b>PIN053: Land between Spalding and Pinchbeck, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 7.77ha Potential open space: 1.1ha Development area: 6.7ha            Potential no of dwellings: 155</p>
<b>1. Housing</b>	<p style="text-align: center;"><b>✓</b></p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;"><b>x</b></p> <p>Some of the facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (off Kelly Close) and playing field (off Rotten Row) are approx. 900m and 670m from the site respectively. However, the closest health centre (The Surgery in Pinchbeck) and Pinchbeck Village Hall are both outside the ideal walking distances.</p> <p>It is anticipated that the increase in population – approximately 341 people (2.2 occupants in each of the 155 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed</p>

	<p>with the CCGs and National Health Service England.</p> <p>Overall, Pinchbeck and Surfleet does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area, about 1.1ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is adjacent to the railway line - which is likely to experience increased traffic in light of the recent upgrade to the line and potential future Rail Freight Interchange at Deeping Fen. There are currently some trees along this boundary but the landscaping may need to be reinforced to help mitigate any noise and air pollution as well as helping to minimise the visual impact generated through proximity to the rail network.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.5km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (650m approx. from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. The site should be developed in conjunction with other sites that have been put forward between Spalding Road, Vernatts Drain, the railway and Market Way in order to facilitate the development of the Spalding Western Relief Road as well as to help provide improved footpath, cycle and public transport links. In addition, in conjunction with Pin024, a development of this scale will provide its own services and facilities.</p> <p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is outside the ideal 400m walking distance.</p> <p>The roads around this part of Spalding are narrow rural lanes and so improvements are likely to be required to accommodate the traffic</p>

	that will be generated by development of the site.
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. The site should be developed in conjunction with other sites that have been put forward between Spalding Road, Vernatts Drain, the railway and Market Way in order to facilitate the development of the Spalding Western Relief Road as well as to help provide improved footpath, cycle and public transport links. In addition, in conjunction with Pin024, a development of this scale will provide its own services and facilities.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (1.9km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 155 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 31 primary pupils and 29 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Pinchbeck East Church of England Primary School is around 1.1km from the site</li> <li>• Spalding Grammar School is approx. 4.3km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.8km</p>

	<p>away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is enclosed by Leylandii hedging and trees which run along the boundary adjacent to the railway line. These features may have value for wildlife (a quality assessment can determine this) and development could have an adverse impact on them. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from defined settlement limits and would extend Pinchbeck/Spalding over the railway line – which currently acts as the perceived end to the built up area at this side of the village - to the west, to the detriment of the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 7.77ha of grade 1 agricultural/horticultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 7.77ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should</p>

	<p>take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 341 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 341 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p>

	The increased population (341 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.
--	--

<b>PIN054: Orchard House Blue Gowt Drove, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 3.98ha Potential open space: 0.56ha Development area: 3.42ha Potential no of dwellings: 80
<b>1. Housing</b>	<b>✓</b>
	Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.  The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.  However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.
<b>2. Health and Well-being</b>	<b>x</b>
	The majority of the facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (adjacent Mill Green level crossing) and playing field (off Rotten Row), the Johnson Community Hospital and Pinchbeck Village Hall are all outside the ideal walking distances.  It is anticipated that the increase in population – approximately 176 people (2.2 occupants in each of the 80 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.  The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.  Overall, Pinchbeck and Surfleet does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area,

	<p>about 0.56ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.7km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (350m approx. from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. Furthermore, if the site were to be developed in conjunction with Pin024, a development of this scale would provide its own services and facilities and would have the potential to provide new crossings of the railway line and Vernatt's Drain. A large scale development can also provide improved footpath, cycle and public transport links. The roads around this part of Spalding are narrow rural lanes and so improvements are likely to be required to accommodate the traffic that will be generated by development of the site.</p> <p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on</p>

	<p>a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (2.1km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that there are no footpaths from the site and cyclists would have to share the existing road network.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 80 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 16 primary pupils and 15 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Primary School is around 1.4km from the site</li> <li>• Spalding Grammar School is approx. 3.1km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.6km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>The site is approx. 500m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p>

	<p>The site is also bordered by trees on all sides which may have value for wildlife (a quality assessment can determine this). Development may have an adverse impact on them. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from defined settlement limits and has a poor relationship with the existing built up area. Its development would create an incongruous group of dwellings in the countryside which would have an adverse impact on the character and appearance of the landscape.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx.3.98ha of grade 1 agricultural land.</p>

<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx.3.98ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as ‘no hazard’ in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>PIN055: Land to the east of Tydd Road, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.82ha Potential no of dwellings: 16
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of the facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (Monk's House Playing Field) and playing field (off Rotten Row), health centre (The Surgery in Pinchbeck) and Pinchbeck Village Hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population – approximately 35 people (2.2 occupants in each of the 16 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Pinchbeck and Surfleet does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the potential number of dwellings, open space may be required. However, given the size of the site, it may be more usefully sought as a financial contribution to improve the quality and multifunctionality of existing open space in to accommodate future residents.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	x
	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p>

	<p>The site is within the ideal short driving (7km) distance to a big supermarket being around 4.9km from the Aldi Store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the relatively isolated nature of the site may deter residents from walking or cycling to reach facilities and services.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in extremely close proximity (10m approx. from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. If the site were to be developed in conjunction with Pin024, a development of this scale would provide its own services and facilities and would have the potential to provide new crossings of the railway line and Vernatt's Drain. A large scale development can also provide improved footpath, cycle and public transport links.</p> <p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (4.7km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that the site is relatively isolated.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	No infrastructure will be lost on site as a consequence of this proposal.
<b>5. Education</b>	x
	<p>The development would be likely to accommodate 16 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 3 primary pupils and 3 secondary pupils. However, all primary and secondary schools and post 18 education providers are outside the ideal walking distance.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	√/x
	<p>The site is approx. 130m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>Additionally, some trees line the northern boundary of the site which may have value for wildlife (a quality assessment can determine this). Development may have an adverse impact on them. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	0
	<p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	x
	The site is detached from defined settlement limits and has a poor relationship with the existing built up area. Its development would

	<p>create an incongruous group of dwellings in the countryside which would have an adverse impact on the character and appearance of the landscape.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<p><b>9. Air, Soil and Water Resources</b></p>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 0.82ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.82ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site.</p>

	<p>However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 35 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>

<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 35 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (35 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>PIN056: Fox Glove Cottage, 4 Blue Gowt Drove, Spalding,</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 1.48ha Potential open space: 0.21ha Development area: 1.27ha  Potential no of dwellings: 44</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of the facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (adjacent Mill Green level crossing) and playing field (off Rotten Row), the Johnson Community Hospital and Pinchbeck Village Hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population – approximately 97 people (2.2 occupants in each of the 44 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In</p>

	<p>the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Pinchbeck and Surfleet does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area, about 0.21ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.5km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (230m approx. from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. If the site were to be developed in conjunction with Pin024, a development of this scale would provide its own services and facilities and would have the potential to provide new crossings of the railway line and Vernatt's Drain. A large scale development can also provide improved footpath, cycle and public transport links.</p> <p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is outside the ideal 400m walking distance.</p> <p>The roads around this part of Spalding are narrow rural lanes and so improvements are likely to be required to accommodate the traffic that will be generated by development of the site.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents</p>

	<p>without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (1.9km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that there are no footpaths from the site and cyclists would have to share the existing road network.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 44 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 9 primary pupils and 8 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Primary School is around 1.2km from the site</li> <li>• Spalding Grammar School is approx. 2.9km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p>

	Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is approx. 350m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>Additionally, the site is bordered by trees on three sides which may have value for wildlife (a quality assessment can determine this). Development may have an adverse impact on them. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from defined settlement limits and has a poor relationship with the existing built up area. Although the site is somewhat screened by the surrounding trees, its development would create an incongruous group of dwellings in the countryside which would have an adverse impact on the character and appearance of the landscape.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. <p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (2.5km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local</p>

	<p>employment, especially given that there are no footpaths from the site and cyclists would have to share the existing road network.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 373 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 75 primary pupils and 71 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Primary School is around 1.9km from the site</li> <li>• Spalding Grammar School is approx. 3.6km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.1km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is approx. 670m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>Additionally, the site is partly bordered by trees which may have value for wildlife (a quality assessment can determine this). Development may have an adverse impact on them. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p>

	<p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from defined settlement limits and has a poor relationship with the existing built up area. Its development would create a large incongruous group of dwellings in the countryside which would have an adverse impact on the character and appearance of the landscape.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 12.43ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p>

	<p>The proposal would lead to the permanent loss of approx. 12.43ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<p><b>12. Climate Change</b></p>	<p style="text-align: center;">✓/x</p> <p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 821 people would generate new car journeys and hence carbon emissions.</p>

	<p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	√/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 821 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (821 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>PIN058: Blue Gowt Drive, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.31ha Potential no of dwellings: 9
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	The majority of the facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (adjacent Mill

	<p>Green level crossing) and playing field (off Rotten Row), the Johnson Community Hospital and Pinchbeck Village Hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population – approximately 20 people (2.2 occupants in each of the 9 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.6km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (320m approx. from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. If the site were to be developed in conjunction with Pin024, a development of this scale would provide its own services and facilities and would have the potential to provide new crossings of the railway line and Vernatt's Drain. A large scale development can also provide improved footpath, cycle and public transport links.</p> <p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially</b></p>	<p style="text-align: center;">✓/x</p>

<p><b>Inclusive Communities</b></p>	<p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (2km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that there are no footpaths from the site and cyclists would have to share the existing road network.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 9 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 2 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Primary School is around 1.3km from the site</li> <li>• Spalding Grammar School is approx. 3km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.5km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new</p>

	<p>primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is approx. 400m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>Additionally, the site is bordered by trees on the north-western and south-eastern facing boundaries which may have value for wildlife (a quality assessment can determine this). Development may have an adverse impact on them. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from defined settlement limits and has a poor relationship with the existing built up area. Although the site is somewhat screened by the surrounding trees and residential properties fronting the road, its development would create an incongruous group of dwellings in the countryside which would have an adverse impact on the character and appearance of the landscape.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p>

	<p>The proposal would lead to the permanent loss of approx. 0.31ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.31ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. <b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 20 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (20 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>PIN059: Land on Blue Gowt Drove, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 1.14ha Potential open space: 0.16ha Development area: 1.08ha Potential no of dwellings: 34
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of the facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (adjacent Mill Green level crossing) and playing field (off Rotten Row), the Johnson Community Hospital and Pinchbeck Village Hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population – approximately 75 people (2.2 occupants in each of the 34 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Pinchbeck and Surfleet does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area, about 0.16ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	x
	It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of

	<p>82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.4km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (70m approx. from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. If the site were to be developed in conjunction with Pin024, a development of this scale would provide its own services and facilities and would have the potential to provide new crossings of the railway line and Vernatt's Drain. A large scale development can also provide improved footpath, cycle and public transport links. The roads around this part of Spalding are narrow rural lanes and so improvements are likely to be required to accommodate the traffic that will be generated by development of the site.</p> <p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (1.9km) are within the ideal 7km drive of the</p>

	<p>site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment, especially given that there are no footpaths from the site and cyclists would have to share the existing road network.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 34 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 7 primary pupils and 6 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Primary School is around 1.1km from the site</li> <li>• Spalding Grammar School is approx. 2.9km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>The site is approx. 200m from a protected site (Vernatt's Drain LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>Additionally, the site is enclosed by trees on all boundaries which may have value for wildlife (a quality assessment can determine this). Development may have an adverse impact on them. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>Furthermore, Blue Gowt Drain runs along the northern boundary of the site. Disturbance due to development can result in the movement of species, therefore undermining their sustainability. Mitigation may be required to offset any potential harm identified but this will depend upon implementation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>

	As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from defined settlement limits and has a poor relationship with the existing built up area. Although the site is somewhat screened by the surrounding trees, its development would create an incongruous group of dwellings in the countryside which would have an adverse impact on the character and appearance of the landscape.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 1.14ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p>

	<p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.14ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: right;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and the majority is identified within the SFRA as 'low hazard' in terms of flood hazard, with a smaller part of the site being 'danger for some'. The majority of the site has flood depths between 0-0.25m, although some is 0.25- 0.5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: right;">✓/x</p>

	<p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 75 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<p><b>13. Economy and Employment</b></p>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 75 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (75 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>PIN060: Tydd Road, Pinchbeck, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 7.48ha Potential open space: 1.05ha Development area: 6.43ha Potential no of dwellings: 224
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.  The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.  However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.
<b>2. Health and Well-being</b>	x
	The majority of the facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space (off Kelly Close) and playing field (off Rotten Row), health centre (The Surgery in Pinchbeck) and Pinchbeck Village Hall are all outside the ideal walking distances.  It is anticipated that the increase in population – approximately 493 people (2.2 occupants in each of the 224 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.  The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.  Overall, Pinchbeck and Surfleet does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the site area, about 1.05ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.  Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.
<b>3. Transport</b>	x
	It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.

	<p>The site is within the ideal short driving (7km) distance to a big supermarket being around 5.3km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the relatively isolated nature of the site may deter residents from walking or cycling to reach facilities and services.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (890m approx. from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road. If the site were to be developed in conjunction with Pin024, a development of this scale would provide its own services and facilities and would have the potential to provide new crossings of the railway line and Vernatt's Drain. A large scale development can also provide improved footpath, cycle and public transport links. The roads around this part of Pinchbeck/Spalding are narrow rural lanes and so improvements are likely to be required to accommodate the traffic that will be generated by development of the site.</p> <p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (4.7km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local</p>

	<p>employment, especially given that the site is relatively isolated. There are also no footpaths from the site and cyclists would have to share the existing road network which may deter residents from using these sustainable modes of travel.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 224 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 45 primary pupils and 43 secondary pupils. However, all primary and secondary schools and post 18 education providers are outside the ideal walking distance.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Blue Gowt Drain runs along the site's northern boundary and so development may have an effect on habitats and BAP species and consequently biodiversity. It may be necessary to create some form of buffer between residential development and the Drain in order to minimize any potential adverse effects.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and</b>	<p style="text-align: center;">x</p>

<b>Townscape</b>	<p>The site is detached from defined settlement limits and has a poor relationship with the existing built up area. Its development would create a large incongruous group of dwellings in the countryside which would have an adverse impact on the character and appearance of the landscape.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 7.48ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 7.48ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a combination of 'danger for most' and 'danger for some' in terms of flood hazard. Flood depths vary across the site between 0.25-0.5m to 1-2m, but the majority of the site has depths of 0.25m – 0.5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p>

	<p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 493 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p>

	The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓/x
	The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 493 people within the ideal 7km drive of local employment.
	Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).
	The increased population (493 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.

<b>PIN061: Highfield Nursery, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.85ha Potential no of dwellings: 17
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.
	The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.
	However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓/x
	Some of the facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field (off Rotten Row) and open space (off Kelly Close) are approx. 690m and 950m from the site respectively. However, the closest health centre (The Surgery in Pinchbeck) and Pinchbeck Village Hall are both outside the ideal walking distances.
	It is anticipated that the increase in population – approximately 37 people (2.2 occupants in each of the 17 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents. The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However,

	<p>County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Pinchbeck and Surfleet does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space, reducing their overall quality. Based on the potential number of dwellings, open space may be required. However, given the size of the site, it may be more usefully sought as a financial contribution to improve the quality and multifunctionality of existing open space in Boston to accommodate future residents.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Pinchbeck and Surfleet) showed that 89.3% of households owned at least one car and 47.2% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.5km from the Morrisons Store in Pinchbeck (Wardentree Lane). However, the site is outside the ideal 1km walk from a local shop. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it would have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for additional traffic to be generated by this site, and cumulatively with other site's nearby, means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand, increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Buses run through Pinchbeck and Spalding into Boston and Spalding town centres throughout the day but the nearest stop is outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Pinchbeck and Surfleet is not a deprived area: Compared with the Lincolnshire average, its long term</p>

<p><b>Communities</b></p>	<p>unemployment rate was below average (23.9% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is less than average (10.7% compared to 18%) and that crime rate per 1000 is also well below the county average at 35.6 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. The site should be developed in conjunction with other sites that have been put forward to the north of the Vernatts Drain in order to facilitate the development of the Spalding Western Relief Road as well as to help provide improved footpath, cycle and public transport links. In addition, in conjunction with Pin024, a development of this scale will provide its own services and facilities.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Wardentree Lane (1.9km) are within the ideal 7km drive of the site. However it is outside the ideal 1km walk. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 17 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 3 primary pupils and 3 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Pinchbeck East Church of England Primary School is around 1.1km from the site</li> <li>• Spalding Grammar School is approx. 4.3km away</li> </ul> <p>The site is within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.8km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the</p>

	<p>number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest in the site itself appears to be limited, although it is within relatively close proximity of a protected site being approx. 790m from the River Glen Corridor LWS. However, the closest public access point for the Corridor is around 1.6km from the site which may discourage high-levels of use.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the existing built-up area and development in that area is relatively limited. The site's development would therefore create an isolated and incongruous group of dwellings in the countryside. This would have an adverse impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Pinchbeck/Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p>

	The proposal would lead to the permanent loss of approx. 0.85ha of grade 1 agricultural land.
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.85ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Holbeach for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity,</p>

	<p>thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the county. It is therefore likely that the anticipated increase in 37 people would generate some new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Pinchbeck/Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they are reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 37 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STJ003: 2-4 St John's Road, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.98ha Potential open space: 0.14ha Development area: 0.84ha Potential no of dwellings: 53
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.  The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.  Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓/x
	The nearest open space is located off The Parkway around 880m from the site and St Norbert's Community Hall is around 450m away. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest health centre (Pennygate Health Centre) and playing field (Monk's House Playing Field) are both outside the ideal walking distances.  It is anticipated that the increase in population - approximately 117 people (2.2 occupants in each of the 53 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.  The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.  Overall Spalding St John's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.14ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.  Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.
<b>3. Transport</b>	✓
	It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St John's) showed that 80.2% of households owned at least one car (below the county average of 82%) and 43.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).

	<p>The site is well within the ideal short 7km driving and 1km walking distance to a big supermarket being around 400m from the Aldi store in Spalding (St Thomas's Road). Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops directly outside the site on St John's Road, making public transport access easy for those living within the site. An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St John's: Compared with the Lincolnshire average, its long term unemployment rate was above average (28.8% compared to 25.6%) as is the percentage of residents without access to a car (19.8% compared to 18%). However, statistics show that crime rate per 1000 is below the county average at 37.4 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan. Furthermore, as discussed in Objective 13, the nearest employment opportunities in Spalding Town Centre (380m) are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p>

	<p>The development would be likely to accommodate 53 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 11 primary pupils and 10 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 490m from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 770m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 810m away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: right;">✓/x</p> <p>Development of the site is not likely to have an adverse impact on any trees or vegetation. However, the site is within approx. 190m of a protected site (Disused March Line LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: right;">✓/x</p> <p>Development of the site could have adverse impacts on the Grade II listed St Johns Road Footbridge situated to the east of the site. However, it is likely that any such impacts could be prevented by careful design.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: right;">✓</p> <p>The site is within the development limits of Spalding and is currently a car dealership. It is surrounded by development meaning that development of the site is not likely to have an adverse impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: right;">✓</p>

<p><b>Water Resources</b></p>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 0.98ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.98ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed,</p>

	<p>it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. However, given that travel to work use by car is higher than for the rest of the county it is likely that the anticipated increase in 117 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable</p>

	<p>manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 117 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (117 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
--	--

STJ004: Former PO Sorting Office, The Crescent, Spalding	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.1ha Potential no of dwellings: 12
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest recreational route along the River Welland is around 300m from the site and the South Holland Centre is approx. 280m away. The closest health centre is Beechfield Medical Centre situated around 650m from the site and the Castle Sports Complex is approx. 840m away.</p> <p>It is anticipated that the increase in population - approximately 26 people (2.2 occupants in each of the 12 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p>

	<p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St John's) showed that 80.2% of households owned at least one car (below the county average of 82%) and 43.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short 7km driving and 1km walking distance to a big supermarket being around 330m from the Lidl store in Spalding (Winsover Centre). Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops approx. 100m from the site outside the Magistrates Court, within the ideal 400m walking distance. An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). The site is also 440m from Spalding Railway Station.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St John's: Compared with the Lincolnshire average, its long term unemployment rate was above average (28.8% compared to 25.6%) as is the percentage of residents without access to a car (19.8% compared to 18%). However, statistics show that crime rate per 1000 is below the county average at 37.4 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan. Furthermore, as discussed in Objective 13, the site is within Spalding Town Centre meaning that employment opportunities are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p>

	<p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 12 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 2 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 1.2km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 340m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 300m away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on some trees at the north-west of the site. However, the site is within approx. 230m of a protected site (River Welland LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">✓/x</p> <p>The site is located within the Spalding Conservation Area and is near to listed buildings – most notably the Grade II listed Sessions House) and buildings of local historic interest. Development of the site could therefore adversely affect the character and setting of a range of heritage assets. However, it is likely that adverse impacts could be avoided by careful design and layout.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the development limits of Spalding and is surrounded by development meaning that redeveloping the site is not likely to have an adverse impact on the character and appearance of the area.</p>

	<p>The former Sorting Office has been disused for some time and so redevelopment is likely to have a positive impact on townscape particularly in terms of reinstating a vibrant streetscene and development form in keeping with its surroundings. Such impact will, however, be dependent on implementation and design.</p>
<p><b>9. Air, Soil and Water Resources</b></p>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 0.10ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.10ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p>

	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including improving health, encouraging sustainable modes of transport, enhancing the range of properties available, not likely having an adverse impact upon the landscape and redevelopment of previously developed land and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. However, given that travel to work use by car is higher than for the rest of the county it is likely that the anticipated increase in 26 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in</p>

	<p>the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 26 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (26 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STJ005: Hawthorn Bank, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario: Total site area: 0.22ha Potential no of dwellings: 7</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓/x</p> <p>Some of the facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Open space is located off Amsterdam Gardens around 490m from the site and the closest health centre is Pennygate Health Centre situated around 670m from the site. However, the nearest playing pitches (Monk's House Playing Field) and community centre (St Norbert's Community Hall) are both outside the ideal walking distances.</p>

	<p>It is anticipated that the increase in population - approximately 15 people (2.2 occupants in each of the 7 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St John's) showed that 80.2% of households owned at least one car (below the county average of 82%) and 43.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short 7km driving distance to a big supermarket being around 980m from the Aldi store in Spalding (St Thomas' Road). The site is also within the ideal 1km walk of a local shop being around 600m from the Premier store on Pennygate. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops 330m from the site on Pennygate, within the ideal 400m walking distance. An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St John's: Compared with the Lincolnshire average, its long term unemployment rate was above average (28.8% compared to 25.6%) as is the percentage of residents without access to a car (19.8% compared to 18%). However, statistics show that crime rate per 1000 is below the county average at 37.4 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p>

	<p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan. Furthermore, as discussed in Objective 13, the site is around 970m from Spalding Town Centre meaning that employment opportunities are within both the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 7 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 180m from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 1.3m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 1.4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>Development of the site is not likely to have an adverse impact on any trees or vegetation. However, the site is within approx. 350m of a protected site (Disused March Line LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p>

	<p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the development limits of Spalding and is surrounded by residential development. The site itself is located behind frontage development meaning that it will not be particularly visible to the public. Consequently, the site is not likely to have an adverse impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 0.22ha of predominantly previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p>

	<p>However this site does secure the redevelopment of 0.22ha of predominantly previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	✓
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. <b>12. Climate Change</b>	✓/x
	Many of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need

	<p>to travel by car. Furthermore, it is likely that the anticipated increase in 9 people would only generate a limited number of new car journeys and associated carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 15 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (15 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STM001: Land to the east of Spalding Common, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.53ha Potential no of dwellings: 16
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-</b>	x

<p><b>being</b></p>	<p>Access to the recreational route alongside South Drove Drain is around 110m from the site. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall, the nearest playing field (Monk's House Playing Field) and health centre (Pennygate Health Centre) are all outside the ideal walking distances. However, development of the Holland Park Urban Extension (2,250 dwellings) to the west may improve the current situation by providing new accessible services and facilities.</p> <p>It is anticipated that the increase in population - approximately 35 people (2.2 occupants in each of the 16 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St. Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the potential number of dwellings, open space may be required. However, given the size of the site, it may be more usefully sought as a financial contribution to improve the quality and multifunctionality of existing open space in Spalding to accommodate future residents.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. Consequently, structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 4.1km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact</p>

	<p>should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (approx. 80m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland) and 5 times a day to Market Deeping; the nearest bus stops 330m from the site adjacent to Stennett Avenue, within the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services and facilities are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment site is Cradge Bank Industrial Estate (2.3km away) and is well within the ideal 7km drive of the site. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 16 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 3 primary pupils and 3 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 3.6km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.9km away</li> </ul>

	<p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 4.4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on hedgerows – and its potential biodiversity and historic interest - along the northern and southern boundaries. If a hedgerow is deemed to be 'important' its removal may be prohibited - Whether a hedgerow is considered to be 'important' depends on whether it meets the criteria set out in the Hedgerow Regulations 1997. Furthermore, the site is within close proximity of two protected sites – South Drove Drain LWS and Cowbit Wash SSSI (100m and 440m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Although the site is detached from the development limits of Spalding, the site is part of a row of frontage dwellings with depth development further to the north. Furthermore, in light of the planning permission for 2,250 dwellings to the west of the B1175 the impact of the site's development on the character and appearance of the area would be acceptable.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: center;">✓</p>

<p><b>Water Resources</b></p>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The site is not agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.53ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with flood depths of '1.0 – 2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<p><b>12. Climate Change</b></p>	<p style="text-align: center;">✓/x</p> <p>Some of the areas facilities and services are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. This could potentially help to lessen the effects of additional residents in terms of the number of new car journeys generated</p>

	<p>and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 35 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (35 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STM002: Land to the east of South Drove, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 0.8ha Potential open space: 0.11ha Development area: 0.69ha  Potential no of dwellings: 24</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>

<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>Access to the recreational route alongside South Drove Drain is approx. 140m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall, the nearest playing field (Monk's House Playing Field) and health centre (Pennygate Health Centre) are all outside the ideal walking distances. However, development of the Holland Park Urban Extension (2,250 dwellings) to the west may improve the current situation by providing new accessible services and facilities.</p> <p>It is anticipated that the increase in population - approximately 53 people (2.2 occupants in each of the 24 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St. Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.11ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. Consequently, structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 4.1km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential</p>

	<p>cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (approx. 130m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland) and 5 times a day to Market Deeping; the nearest bus stops 370m from the site adjacent to Stennett Avenue, within the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services and facilities are outside the ideal walking distances which may have an adverse impact on social inclusion. As discussed in Objective 13 the nearest employment site is Cradge Bank Industrial Estate (2.3km away) and is well within the ideal 7km drive of the site. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 24 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 5 primary pupils and 5 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 3.7km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 4km away</li> </ul>

	<p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 4.4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on a hedgerow – and its potential biodiversity and historic interest - along the southern boundary. If a hedgerow is deemed to be 'important' its removal may be prohibited - Whether a hedgerow is considered to be 'important' depends on whether it meets the criteria set out in the Hedgerow Regulations 1997. Furthermore, the site is within close proximity of two protected sites – South Drove Drain LWS and Cowbit Wash SSSI (110m and 420m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Although the site is detached from the development limits of Spalding, the site is part of a row of frontage dwellings with depth development further to the north. Furthermore, in light of the planning permission for 2,250 dwellings to the west of the B1175 the impact of the site's development on the character and appearance of the area would be acceptable.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: center;">✓</p>

<p><b>Water Resources</b></p>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>However this site does secure the redevelopment of 0.8ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.8ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as ‘danger for most’ in terms of flood hazard, with flood depths of ‘1.0 – 2.0m’. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<p><b>12. Climate Change</b></p>	<p style="text-align: center;">✓/x</p> <p>Some of the areas facilities and services are outside the ideal walking distances from the site meaning that there may be less potential to</p>

	<p>reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. This could potentially help to lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 53 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (53 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
<b>STM005: Land to the west of Spalding Drove, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 11.97ha Potential open space: 1.68ha Development area: 10.29ha  Potential no of dwellings: 359</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p>

	Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>Access to the recreational route along the Coronation Channel is around 590m away, although if a new access were to be incorporated along the northern boundary this would bring it within 120m. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall, the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 790 people (2.2 occupants in each of the 359 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 1.68ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is opposite an allocated employment site (Clay Lake Industrial Estate) which may have an impact on the amenities that would be enjoyed by the residents of new dwellings. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 1.7km from the Aldi store in Spalding (St Thomas's Road). However, the site is just outside the ideal 1km walk of a local shop (Jentone Stores on London Road). Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p>

	<p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops 840m from the site adjacent Churchill Drive, outside the ideal 400m walking distance. An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. However, as discussed in Objective 13, the nearest employment site is Clay Lake Industrial Estate (580m away) and is therefore within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 359 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 72 primary pupils and 68 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Parish Church of England Day School is around 1.4km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 1.5km away</li> </ul>

	<p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.2km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The northern boundary of the site is adjacent to the Coronation Channel - a protected Local Wildlife Site - and so development may have an effect on habitats and BAP species and consequently biodiversity. It would be necessary to create a buffer between residential development and the river in order to minimize the likely adverse effects.</p> <p>Development may also have an adverse impact on a number of trees within the site. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">x</p> <p>Built heritage assets (including Historic Parks and Gardens) – Although there is some development within the site it presents a natural setting to the waterway as viewed from the Spalding Conservation Area. The site contributes to the wider setting of the Conservation Area. The opposite bank is characterised by housing estate development. When viewed from the bridge, the impact is lessened due to the trees along the water's edge. However, as experienced from the waterway, this has fundamentally changed the character of the waterway on that bankside. There is a wildness about the Coronation Channel frontage of this site that contributes to the wider setting of the conservation area. Development of the site would therefore be likely to have a negative effect.</p> <p>Potential mitigation - naturalistic planting along the Coronation Channel frontage to complement the existing trees. Development set back into the site. A design brief that emphasises a landscape driven approach to layout;</p> <p>Potential enhancement – none.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and</b>	<p style="text-align: center;">x</p>

<p><b>Townscape</b></p>	<p>The site is adjacent to the development limits of Spalding. It would extend development to the south of the Coronation Channel which is perceived as the natural end to residential development. The landscape and visual sensitivity of the site would increase from the south and the east. Mitigation such as structural landscaping would be necessary to help integrate the site with the local environment.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<p><b>9. Air, Soil and Water Resources</b></p>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and a pumping station is located in close proximity - these must remain accessible at all times. The design of the site should take this into consideration.</p> <p>South Holland District Council's contaminated land register indicates that there is some unknown filled land on the site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 11.97ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 11.97ha of greenfield land.</p>

	This site is not within a Mineral Safeguarding Area.
<b>11. Flood Risk</b>	✓/x
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and the majority is identified within the SFRA as 'danger for most' in terms of flood hazard. Flood depths vary across the site from 0-0.25m to 1.0-2.0m, but the greatest part of the site is 0.5-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	✓/x
	<p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. Nonetheless, the anticipated increase in population (790 people) that development of this site is likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p>

	<p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 790 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (790 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions (particularly along the A16) do not worsen and are detrimental to the economy.</p>

<b>STM006: Land to the east of Spalding Common, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 1.41ha Potential open space: 0.2ha Development area: 1.21ha  Potential no of dwellings: 42</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-</b>	✓/x

<p><b>being</b></p>	<p>Some of the facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Access to the recreational route along the River Welland Green Corridor and Spalding Common Community Hall are approx. 520m and 580m from the site respectively. However, the nearest playing field (Monk's House Playing Field) and health centre (Pennygate Health Centre) are both outside the ideal walking distances. Development of the Holland Park Urban Extension (2,250 dwellings) to the west may improve the current situation by providing new accessible services and facilities.</p> <p>It is anticipated that the increase in population - approximately 92 people (2.2 occupants in each of the 42 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St. Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.2ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. Consequently, structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 3.5km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other</p>

	<p>hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (approx. 290m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland) and 5 times a day to Market Deeping; the nearest bus stops 430m from the site adjacent to Stennett Avenue, outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment site is Cradge Bank Industrial Estate (1.5km away) and is well within the ideal 7km drive of the site. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 42 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 8 primary pupils and 8 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 3km from the site</li> </ul>

	<ul style="list-style-type: none"> <li>Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.7km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">√/x</p> <p>Development of the site may have an adverse impact on mature trees along the northern boundary. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation. Furthermore, the site is within close proximity of two protected sites – River Welland LWS and Cowbit Wash SSSI (180m and 730m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Although the site is detached from the development limits of Spalding, the site is part of a row of frontage dwellings with depth development further to the north and south. Furthermore, in light of the planning permission for 2,250 dwellings to the west of the B1175 the impact of the site's development on the character and appearance of the area would be acceptable.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: center;">x</p>

<b>Water Resources</b>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 1.41ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.41ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and the majority of it is identified within the SFRA as 'danger for most' in terms of flood hazard. Flood depths vary across the site but the majority is 1.0-2.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower</p>

	<p>here than for the rest of the county. Nonetheless, the anticipated increase in population (92 people) that development of this site is likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 92 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (92 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STM007: Land to the east of Spalding Common, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 0.66ha Potential open space: 0.09ha Development area: 0.57ha  Potential no of dwellings: 20</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p>

	<p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>Access to the recreational route alongside South Drove Drain is around 130m from the site. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall, the nearest playing field (Monk's House Playing Field) and health centre (Pennygate Health Centre) are all outside the ideal walking distances. Development of the Holland Park Urban Extension (2,250 dwellings) to the west may improve the current situation by providing new accessible services and facilities.</p> <p>It is anticipated that the increase in population - approximately 44 people (2.2 occupants in each of the 20 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St. Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.09ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. Consequently, structural landscaping such as trees of mixed provenance may be necessary along this boundary to help mitigate any noise and air pollution.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 4km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs.</p>

	<p>However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (approx. 30m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland) and 5 times a day to Market Deeping; the nearest bus stops 260m from the site adjacent to Stennett Avenue, within the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services and facilities are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment site is Cradge Bank Industrial Estate (2.2km away) and is well within the ideal 7km drive of the site. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓/x</p>

	<p>The development would be likely to accommodate 20 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 4 primary pupils and 4 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 3.5km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.8km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 4.3km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on hedgerows – and its potential biodiversity and historic interest - along the northern and southern boundaries. If a hedgerow is deemed to be 'important' its removal may be prohibited - Whether a hedgerow is considered to be 'important' depends on whether it meets the criteria set out in the Hedgerow Regulations 1997. Furthermore, the site is within close proximity of two protected sites – South Drove Drain LWS and Cowbit Wash SSSI (120m and 450m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<p><b>7. Heritage</b></p>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<p><b>8. Landscape and Townscape</b></p>	<p style="text-align: center;">✓</p> <p>Although the site is detached from the development limits of Spalding, the site is part of a row of frontage dwellings with depth</p>

	<p>development further to the north. Furthermore, in light of the planning permission for 2,250 dwellings to the west of the B1175 the impact of the site's development on the character and appearance of the area would be acceptable.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.66ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with flood depths of '1.0 – 2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p>

	<p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some of the areas facilities and services are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. This could potentially help to lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 44 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (44 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STM008: Land to the east of Spalding Common, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.12ha Potential no of dwellings: 4
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓/x
	<p>Some of the facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Open space (off Goodfellows Road) and Spalding Common Community Hall are approx. 250m and 140m from the site respectively. However, the nearest playing field (Monk's House Playing Field) and health centre (Pennygate Health Centre) are both outside the ideal walking distance. Development of the Holland Park Urban Extension (2,250 dwellings) to the west may improve the current situation by providing new accessible services and facilities.</p> <p>It is anticipated that the increase in population - approximately 9 people (2.2 occupants in each of the 4 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale means that there are limited opportunities to mitigate such impacts effectively.</p>
<b>3. Transport</b>	✓/x
	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p>

	<p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 3km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site is in close proximity (approx. 490m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland) and 5 times a day to Market Deeping; the nearest bus stops 150m from the site adjacent to Spalding Common Community Hall, within the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services and facilities are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment site is Cradge Bank Industrial Estate (1.3km away) and is well within the ideal 7km drive of the site. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	No infrastructure will be lost on site as a consequence of this proposal.
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 4 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 2.6km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.8km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.3km away at the Red Lion Quarter.</p> <p>Spalding currently has a lack of capacity at primary and secondary level. If additional school places are needed to meet the needs of students living in the development, given the size of the site, it is expected that this would be delivered by the LEA, who will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on mature trees along the eastern boundary. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation. Furthermore, the site is in close proximity to a protected site – River Welland LWS (190m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Although the site is detached from the development limits of Spalding, the site is part of a row of frontage dwellings with depth development further to the north and south. Furthermore, in light of the planning permission for 2,250 dwellings to the west of the B1175 the site's development would become more appropriate.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and</b>	<p style="text-align: center;">✓</p>

<p><b>Water Resources</b></p>	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>The site is not agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.12ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as a combination of 'danger for most', 'danger for some' and 'low hazard' in terms of flood hazard. Flood depths vary across the site with an almost equal proportion of 0-0.25m, 0.25-0.5m and 0.5-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that</p>

	<p>the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	✓/x
	<p>Some of the areas facilities and services are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. This could potentially help to lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and</b>	✓/x

<b>Employment</b>	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 9 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (9 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>
-------------------	--

STM009: Land to the north of Burr Lane, Spalding	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 0.91ha Potential open space: 0.13ha Development area: 0.78ha            Potential no of dwellings: 27</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>Access to the recreational route along the River Welland is approx. 840m from the site. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall, the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 59 people (2.2 occupants in each of the 27 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p>

	<p>Overall Spalding St Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.13ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.5km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops 1.3km from the site near Hawthorne Bank, outside the ideal 400m walking distance. Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland).</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for</p>

	<p>residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment site is Clay Lake Industrial Estate (1.2km away) and is well within the ideal 7km drive of the site. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 27 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 5 primary pupils and 5 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 2.1km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.8km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site – New River LWS (340m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity. There are some trees and shrubs within the site and part of the site appears to have been left in a semi-natural state. Consequently, the land could provide space for the development (if not there at present) or enhancement (if already present) of multiple/various habitats which will support a range of species. Development of the site will affect the ecosystem present, by potentially affecting the water table and changing the availability of ground water, unless carefully managed surface water pollution will be a problem. Disturbance due to development can result in the movement of species, therefore undermining</p>

	<p>their sustainability.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Spalding with open views to the south-east. Development of the site would have an adverse impact on the character and appearance of the area as it would extend development further east away from the current built-up area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>South Holland District Council's contaminated land register indicates that there is some unknown filled land on the site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance</p>

	<p>and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 0.91ha of grade 2 agricultural/horticultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;"><b>x</b></p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.91ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;"><b>✓/x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as ‘danger for most’ in terms of flood hazard. Flood depths vary across the site from 0.25-0.5m to 1.0m-2.0m, but the majority is ‘0.5m -1.0m’. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p>

	<p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. Nonetheless, the anticipated increase in population (59 people) that development of this site is likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 59 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (59 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STM011: Land to the east of Spalding Common, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 9.76ha Potential open space: 1.4ha Development area: 8.36ha  Potential no of dwellings: 293</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>Access to the recreational route along the River Welland Green Corridor is around 250m from the site. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall, the nearest playing field (Monk's House Playing Field) and health centre (Pennygate Health Centre) are all outside the ideal walking distances. Development of the Holland Park Urban Extension (2,250 dwellings) to the west may improve the current situation by providing new accessible services and facilities.</p> <p>It is anticipated that the increase in population - approximately 645 people (2.2 occupants in each of the 293 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St. Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 1.4ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the proposed route of the Spalding Western Relief Road which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site in the future. However, development of this scale offers opportunities to mitigate such</p>

	impacts effectively.
<b>3. Transport</b>	x
	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 3.7km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site is in close proximity (approx. 170m from the edge of the site) to the proposed route of the Spalding Western Relief Road and therefore it has the potential to contribute towards the delivery of this road.</p> <p>Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland) and 5 times a day to Market Deeping; the nearest bus stops 630m from the site adjacent to Stennett Avenue, outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	✓/x
	<p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13 the nearest employment site is Cradge Bank Industrial Estate (1.8km away) and is well within the ideal 7km</p>

	<p>drive of the site. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 293 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 59 primary pupils and 56 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 3.3km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 3.5km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site falls within a SSSI Impact Risk Zone. Upon receiving any planning application to develop the site for 100 dwellings or more, the local planning authority must consult Natural England for advice on how impacts might be avoided or mitigated.</p> <p>Development of the site is not likely to have an adverse impact on any trees or vegetation within the site. However, Fantail Mill Drain runs along the south-western facing boundary and the site is also within close proximity of two protected sites – River Welland LWS and Cowbit Wash SSSI (190m and 490m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	0

	<p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is detached from the development limits of Spalding and its development would adversely alter the character and appearance of the area. However, in light of the planning permission for 2,250 dwellings to the west of the B1175 the site's development would become more appropriate.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and a pumping station is also located at the north west of the site. These must remain accessible and so the design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 9.76ha of Grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p>

	<p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 9.76ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;"><b>x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with flood depths of '1.0 – 2.0m' for the majority of the site and 0.5-1m for the remainder. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. Nonetheless, the anticipated increase in population (645 people) that development of this site is likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 645 people within the ideal 7km drive of local employment.</p>

	<p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (645 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
--	---

**STM015: Land between Cowbit Road and Spalding Drive, Spalding**

<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 5.79ha Potential open space: 0.81ha Development area: 4.98ha  Potential no of dwellings: 174</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>Access to the recreational route along the Coronation Channel is around 620m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall, the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 383 people (2.2 occupants in each of the 174 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.81ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p>

	<p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 1.5km from the Aldi store in Spalding (St Thomas's Road). Furthermore, the site is also within the ideal 1km walk of a local shop being approx. 870m from Jentone Stores on London Road. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stop's are around 880m from the site near Briton Court on London Road, outside the ideal 400m walking distance. An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday). Bus services also operate hourly to Peterborough (via Cowbit and Crowland) and 5 times a day to Market Deeping.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p>

	<p>As discussed in Objective 13 the nearest employment site is Cradge Bank Industrial Estate (1.1km away) and is therefore within the ideal 7km drive of the site. This would have a positive impact, providing good access for residents to local employment. However, it is just outside the ideal 1km walk.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 174 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 35 primary pupils and 33 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 1.9km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 1.3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 1.8km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site – Coronation Channel LWS (260m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>Development may also have an adverse impact on some trees within the site. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation. However, the linear nature of the site does not lend itself particularly well to incorporating green infrastructure. Developing this site in combination with other surrounding sites would be better suited to providing this.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>

	As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.
<b>7. Heritage</b>	<p style="text-align: center;">?</p> <p>Built heritage assets (including Historic Parks and Gardens) - The frontage of the site is within the Spalding Conservation Area. There are views behind number 48 Cowbit Road where the open countryside beyond is visible and forms part of the wider setting of the Conservation Area. To access the site would require the alteration of an existing access at the side of a well presented early 19<sup>th</sup> century traditional building. This building marks the end of the Conservation Area on this frontage. The development of this site will impact on the wider setting of the Conservation Area and its character at its Cowbit Road entrance. It will impact on the setting of number 48 as a good quality traditional building at the entrance to the conservation area. However, it is considered that there is insufficient information on which to determine the effect. Potential mitigation – none; Potential enhancement – not applicable.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>Although the site is adjacent to the development limits of Spalding it would not relate particularly well to the current built form of the area. Consequently, development of the site would have an adverse impact on the character and appearance of the area. However, if brought forward in conjunction with the sites to the north (and potentially the south) it would act as a more natural extension to the current built area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the</p>

	<p>new housing has an appropriate water supply.</p> <p>Sewers cross the site and these must remain accessible at all times. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 5.79ha of grade 2 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 5.79ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with flood depths of '1.0 – 2.0m' for the majority of the site and 0.5-1m for the remainder. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. Nonetheless, the anticipated increase in population (383 people) that development of this site is likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p>

	The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 383 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (383 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions (particularly along the A16) do not worsen and are detrimental to the economy.</p>

<b>STM016: Land between Cowbit Road and Spalding Drove, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 26.29ha Potential open space: 3.68ha Development area: 22.61ha Potential no of dwellings: 789
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>Access to the recreational route along the River Welland is around 840m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall, the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 1,736 people (2.2 occupants in each of the 789 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p>

	<p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 3.68ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase considerably with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the south-eastern boundary of the site borders a scrapyard which may have an impact on the amenities that would be enjoyed by new dwellings. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 1.8km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops 1km from the site near Hawthorne Bank, outside the ideal 400m walking distance. Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p>

	<p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. However, as discussed in Objective 13, the nearest employment site is Cradge Bank Industrial Estate (890m away) and is therefore within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 789 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 158 primary pupils and 150 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 1.7km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 1.8km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green</b>	<p style="text-align: center;">✓/x</p> <p>The site falls within a SSSI Impact Risk Zone. Upon receiving any planning application to develop the site for 100 dwellings or more, the local planning authority must consult Natural England for advice on how impacts might be avoided or mitigated.</p>

<b>Infrastructure</b>	<p>The site is in close proximity to a protected site – Coronation Channel LWS (430m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity. Development could also have an adverse impact on some trees along the north-western boundary of the site. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation through green infrastructure, for example.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>Although the site is adjacent to the development limits of Spalding its development would greatly increase the perceived built up area of the town. Consequently, development of the site would have an adverse impact on the character and appearance of the area. However, if brought forward in conjunction with the sites to the north (and potentially the south) it would act as a more natural extension to the current built form.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the</p>

	<p>new housing has an appropriate water supply.</p> <p>Water mains and sewers cross the site and a pumping station is located in close proximity - these must remain accessible. The design of the site should take this into consideration.</p> <p>South Holland District Council's contaminated land register indicates that the site contains a former railway meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 26.29ha of Grade 2 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<b>x</b>
	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 26.29ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<b>x</b>
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and the vast majority of it is identified within the SFRA as 'danger for most', with some even being 'danger for all' in terms of flood hazard. The vast majority of the site has a flood depth of '1.0 – 2.0m', with a very small part being 0.5-1m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<b>✓/x</b>
	<p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. Nonetheless, the anticipated increase in population (1,736 people) that development of this site is likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in</p>

	<p>the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 1,736 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (1,736 people) will generate considerable additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions (particularly along the A16) do not worsen and are detrimental to the economy.</p>

STM017: Land to the west of Spalding Drive, Spalding	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 8.66ha Potential open space: 1.21ha Development area: 7.45ha  Potential no of dwellings: 260</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>Access to the recreational route along the Coronation Channel is around 340m away, although if a new access were to be incorporated along the northern boundary this would bring it within 100m. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing</p>

	<p>development for such facilities. The South Holland Centre, the closest sports facilities (Castle Sports Complex) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 572 people (2.2 occupants in each of the 260 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 1.21ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is opposite an allocated employment site (Clay Lake Industrial Estate) which may have an impact on the amenities that would be enjoyed by the residents of new dwellings. However, development of this scale offers opportunities to mitigate such impacts effectively.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.7km from the Aldi store in Spalding (St Thomas's Road). However, the site is just outside the ideal 1km walk of a local shop being 1.1km from the Tesco Express on Matmore Gate. Moreover, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops 960m from the site on Clay Lake, outside the ideal 400m walking distance. An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday).</p>

<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan. However, as discussed in Objective 13, the nearest employment site is Clay Lake Industrial Estate (170m away) and is therefore within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓</p> <p>The development would be likely to accommodate 260 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 52 primary pupils and 49 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Parish Church of England Day School is around 910m from the site</li> <li>• Spalding High School (with 6<sup>th</sup> Form) is approx. 1.2km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p>

	Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The northern boundary of the site is adjacent to the Coronation Channel - a protected Local Wildlife Site - and so development may have an effect on habitats and BAP species and consequently biodiversity. It would be necessary to create a buffer between residential development and the river in order to minimize the likely adverse effects.</p> <p>There may be some opportunities, through good design, to mitigate the potential negative impacts on biodiversity, and make some local improvements, through using a mix of species and provenance in the landscaping and/or green infrastructure.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Spalding and it would extend development to the south of the Coronation Channel which is perceived as the natural end to residential development. The landscape and visual sensitivity of the site would increase from the south and the east. Mitigation such as structural landscaping would be necessary to help integrate the site with the local environment.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As</p>

	<p>discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>South Holland District Council's contaminated land register indicates that there is some unknown filled land on the site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 8.66ha of Grade 2 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<b>x</b>
	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 8.66ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<b>x</b>
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and the vast majority of it is identified within the SFRA as 'danger for most', with some even being 'danger for all' in terms of flood hazard. The vast majority of the site has a flood depth of '1.0 – 2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<b>✓/x</b>
	<p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. Nonetheless, the anticipated increase in population (572 people) that development of this site is likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p>

	<p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 572 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (572 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions (particularly along the A16) do not worsen and are detrimental to the economy.</p>

<b>STM018: Land between Cowbit Road and Spalding Drove, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 37.6ha Potential open space: 5.3ha Development area: 32.3ha  Potential no of dwellings: 1,128</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>Access to the recreational route along the River Welland is around 520m away. However, the majority of facilities and services that</p>

	<p>would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall, the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 2,482 people (2.2 occupants in each of the 1128 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 5.3ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase considerably with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.1km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops 1.2km from the site near Hawthorne Bank, outside the ideal 400m walking distance. Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland).</p>

<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. However, as discussed in Objective 13, the nearest employment site is Clay Lake Industrial Estate (750m away) and is therefore within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓</p> <p>The development would be likely to accommodate 1128 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 226 primary pupils and 214 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 1.8km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 1.9km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.4km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p>

	Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site falls within a SSSI Impact Risk Zone. Upon receiving any planning application to develop the site for 100 dwellings or more, the local planning authority must consult Natural England for advice on how impacts might be avoided or mitigated.</p> <p>The site is in close proximity to a protected site – New River LWS (530m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity. Development may have an adverse impact on some trees on the site. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation through green infrastructure, for example.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Spalding and its development would not relate particularly well to the existing built up area of the town. Furthermore, it would create a large incongruous group of dwellings and would greatly increase the perceived extent of the built up area of Spalding. Consequently, development of the site would have an adverse impact on the character and appearance of the area. However, if brought forward in conjunction with the sites to the north (up to the Coronation Channel) it would act as an extension to the current built form.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>South Holland District Council's contaminated land register indicates that the site contains a former railway meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 37.6ha of grade 2 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;"><b>x</b></p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 37.6ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;"><b>x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and the majority of the site is identified within the SFRA as 'danger for most' and 'danger for all'. The vast majority of the site has a flood depth of '1.0 – 2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. Nonetheless, the anticipated increase in population (2,482 people) that development of this site is</p>

	<p>likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 2,482 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (2,482 people) will generate considerable additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions (particularly along the A16) do not worsen and are detrimental to the economy.</p>

<b>STM019: Land to the north of Burr Lane, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 2.17ha Potential open space: 0.30ha Development area: 1.87ha  Potential no of dwellings: 65</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>

<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Access to the recreational route along the River Welland, Spalding Common Community Hall and the closest playing field (Monk’s House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 143 people (2.2 occupants in each of the 65 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP’s, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St Mary’s does not have enough open space to meet its resident’s needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.30ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary’s) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.8km from the Aldi store in Spalding (St Thomas’s Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p>

	<p>The nearest bus stops 1.6km from the site near Hawthorne Bank, outside the ideal 400m walking distance. Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment site is Clay Lake Industrial Estate (1.2km away) and is well within the ideal 7km drive of the site. However, it is just outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 65 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 13 primary pupils and 12 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Parish Church of England Day School is around 2.3km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.6km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.1km away at the Red Lion Quarter.</p>

	<p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site – New River LWS (490m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity. Furthermore, there are some trees along the eastern boundary and within the site as well as some shrubs/vegetation. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Spalding. Development of the site would create a large incongruous group of dwellings in the countryside, altering the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As</p>

	<p>discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;"><b>x</b></p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 2.17ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;"><b>x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with flood depths of 0.5 – 2.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. Nonetheless, the anticipated increase in population (143 people) that development of this site is likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p>

	<p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 143 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (143 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions (particularly along the A16) do not worsen and are detrimental to the economy.</p>

<b>STM021: Land to the north of Burr Lane, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 1.75ha Potential open space: 0.25ha Development area: 1.50ha  Potential no of dwellings: 52</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Access to the recreational route along the River Welland, Spalding Common Community Hall, and the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 114 people (2.2 occupants in each of the 52 dwellings) – would place</p>

	<p>additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.25ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.8km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops 1.6km from the site near Hawthorne Bank, outside the ideal 400m walking distance. Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p>

	<p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion. However, as discussed in Objective 13, the nearest employment site is Clay Lake Industrial Estate (950m away) and is therefore within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 52 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 10 primary pupils and 10 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Parish Church of England Day School is around 2.1km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.6km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 3.1km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site – New River LWS (660m approx.) - and so development may have an effect on habitats</p>

<b>and Green Infrastructure</b>	<p>and BAP species and consequently biodiversity. However, development is not likely to have an adverse impact on any trees or vegetation within the site.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – The site is located within a significant Iron Age Romano British landscape, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Spalding and there are relatively open views to the north and south. Development of the site would create a large incongruous group of dwellings in the countryside, altering the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>South Holland District Council's contaminated land register indicates that there is some unknown filled land on the site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p>

	The site is not agricultural land.
<b>10. Sustainable use of Land and Waste</b>	<b>x</b>
	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.75ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<b>x</b>
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard. Flood depths range from 0.5m-2.0m across the site. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<b>✓/x</b>
	<p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. Nonetheless, the anticipated increase in population (114 people) that development of this site is likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p>

	The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓/x
	The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 114 people within the ideal 7km drive and 1km walk of local employment.
	Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).
	The increased population (114 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions (particularly along the A16) do not worsen and are detrimental to the economy.

<b>STM023: Land to the north of Burr Lane, Spalding</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.29ha Potential no of dwellings: 9
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.
	The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.
	However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.
<b>2. Health and Well-being</b>	x
	Access to the recreational route along the River Welland is approx. 770m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall and the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.
	It is anticipated that the increase in population - approximately 20 people (2.2 occupants in each of the 9 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.

	<p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.4km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops 1.2km from the site near Hawthorne Bank, outside the ideal 400m walking distance. Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland).</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for</p>

	<p>residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment site is Cradge Bank Industrial Estate (1.3km away) and is well within the ideal 7km drive of the site. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 9 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 2 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 2.1km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.2km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.6km away at the Red Lion Quarter.</p> <p>Spalding currently has a lack of capacity at primary and secondary level. If additional school places are needed to meet the needs of students living in the development, given the size of the site, it is expected that this would be delivered by the LEA, who will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site – New River LWS (270m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity. The site appears to have been left in a semi-natural state and so the land could provide space for the development (if not there at present) or enhancement (if already present) of multiple/various habitats which will support a range of species. Development of the site will affect the ecosystem present, by potentially affecting the water table and changing the availability of ground water, unless carefully managed surface water pollution will be a problem. Disturbance due to development can result in the movement of species, therefore undermining their sustainability.</p>

	There is no significant geodiversity at this site - it is unlikely that a development will have an impact.
<b>7. Heritage</b>	0 No significant historic or culturally-significant features are likely to be affected by development of the site.
<b>8. Landscape and Townscape</b>	✓ Although the site is detached from the development limits of Spalding, there is residential development to the west and glasshouses to the east. Consequently, development of the site is likely to have little impact on the character and appearance of the area. The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.
<b>9. Air, Soil and Water Resources</b>	x Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area. Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater. New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply. The proposal would lead to the permanent loss of approx. 0.29ha of grade 2 agricultural/horticultural land.
<b>10. Sustainable use of Land and Waste</b>	x The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers. As the site would involve new development it is inevitable that there will be an increase in household waste production. The proposal would lead to the permanent loss of approx. 0.29ha of greenfield land. This site is not within a Mineral Safeguarding Area.

<b>11. Flood Risk</b>	<p style="text-align: right;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as a combination of ‘danger for some’ and ‘danger for most’ in terms of flood hazard. The majority of the site has flood depths between 0.25m – 0.5m, with a small part being 0.5m -1m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: right;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases,</p>

	<p>in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 20 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (20 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STM025: Land to the north of Burr Lane, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario: Total site area: 0.26ha Potential no of dwellings: 8</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>Access to the recreational route along the River Welland is approx. 990m from the site. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall and the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p>

	<p>It is anticipated that the increase in population - approximately 18 people (2.2 occupants in each of the 8 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car and 42.9% travelled to work by car/van, just above the Lincolnshire average of 42.1%.</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.6km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops 1.4km from the site near Hawthorne Bank, outside the ideal 400m walking distance. Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p>

	<p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment site is Clay Lake Industrial Estate (1.1km away) and is well within the ideal 7km drive of the site. However, it is just outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 8 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 2 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding Parish Church of England Day School is around 2.2km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.4km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.9km away at the Red Lion Quarter.</p> <p>Spalding currently has a lack of capacity at primary and secondary level. If additional school places are needed to meet the needs of students living in the development, given the size of the site, it is expected that this would be delivered by the LEA, who will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to a protected site – New River LWS (480m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity. Furthermore, there are some trees along the eastern boundary. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by</p>

	<p>retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>Although the site is detached from the development limits of Spalding there are residential properties to the east and west. Consequently, development of the site is likely to have little impact on the character and appearance of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>South Holland District Council's contaminated land register indicates that there is some unknown filled land on the site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p>

	<p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.26ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;"><b>x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with flood depths of 0.5-2.0m across the majority of the site, with a minor part being '0.5m -1.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. This could potentially help to lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 18 people within the ideal 7km drive of local employment.</p>

	<p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (18 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>
--	--

<b>STM027: Land to the west of Fen End Lane, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario: Total site area: 0.24ha Potential no of dwellings: 7</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>Access to the recreational route along the River Welland is approx. 1km away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall and the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 15 people (2.2 occupants in each of the 7 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore the site is adjacent to the B1173 which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p>

	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.7km from the Aldi store in Spalding (St Thomas's Road). However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops 1.4km from the site near Hawthorne Bank, outside the ideal 400m walking distance. Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment site is Cradge Bank Industrial Estate (1.6km away) and is well within the ideal 7km drive of the site. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and</p>

	<p>inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 7 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School is around 2.4km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) is approx. 2.4km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.9km away at the Red Lion Quarter.</p> <p>Spalding currently has a lack of capacity at primary and secondary level. If additional school places are needed to meet the needs of students living in the development, given the size of the site, it is expected that this would be delivered by the LEA, who will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>The site is in close proximity to two protected sites – New River LWS and Cowbit Wash SSSI (120m and 740m approx.) - and so development may have an effect on habitats and BAP species and consequently biodiversity. Development of the site may also have an adverse affect on some trees and shrubs along the site's boundaries. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Although the site is detached from the development limits of Spalding, the site is behind residential development that faces onto Fen End Lane and is adjacent Cowbit Road (B1173) which is much higher than the level of the site. Consequently, development of the site is likely to have little impact on the character and appearance of the area.</p>

	The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.24ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for</p>

	<p>its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there may be less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, car ownership is lower here than for the rest of the county. This could potentially help to lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable</p>

	<p>manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 15 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (15 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>
--	---

STM029: Land to the north of Burr Lane, Spalding	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 0.92ha Potential open space: 0.13ha Development area: 0.79ha            Potential no of dwellings: 28</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>Access to the recreational route along the River Welland is approx. 790m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall and the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 62 people (2.2 occupants in each of the 28 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents. The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p>

	<p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Spalding St Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.13ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.4km from the Aldi store in Spalding (St Thomas's Road). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. Furthermore there are no footways along Burr Lane and there are poor pedestrian and cycling links to the rest of Spalding from the site. Bicycles would have to share the existing highway network with motorists which may discourage cycle use.</p> <p>The potential for additional traffic to be generated by this site, as well as other sites nearby, means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops are on Hawthorne Bank, well outside the ideal 400m walking distance. Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland).</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p>

	<p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13, the nearest employment site is Cradge Bank Industrial Estate (1.3km away) and is well within the ideal 7km drive of the site. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 28 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 6 primary pupils and 5 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School around 2.1km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) approx. 2.2km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.6km away at the Red Lion Quarter.</p> <p>Spalding currently has a lack of capacity at primary and secondary level. If additional school places are needed to meet the needs of students living in the development, given the size of the site, it is expected that this would be delivered by the LEA, who will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity</b>	<p style="text-align: center;">✓/x</p> <p>The biodiversity interest in the site itself appears to be limited, although the site is in close proximity to a protected site being approx.</p>

<b>and Green Infrastructure</b>	<p>160m from the New River LWS. A Public Right of Way runs adjacent to the LWS meaning that there could be increased recreational pressure and footfall resulting from a larger population in the area which could have an adverse impact on the biodiversity within this protected site.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Although the site is detached from the existing built-up area of Spalding, its development is unlikely to have an adverse impact on the character and appearance of the area, particularly given that a large part of the site is located behind existing residential properties on Burr Lane and Fen End Lane.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>However this site would secure the redevelopment of 0.92ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p>

	<p>However this site would secure the redevelopment of 0.92ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<b>✓/x</b>
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as a combination of 'danger for some', 'danger for most' and 'low hazard'. Flood depths across the site range from 0-0.25m, 0.25-0.5m and 0.5-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Spalding for the plan period, and other benefits including acceptable impact upon the landscape and generating employment during the construction period and thereby providing some protection to the local economy.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<b>✓/x</b>
	<p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is</p>

	<p>less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 62 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (62 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>
<b>STM030: Land to the east of Barrier Bank and north of Burr Lane, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 5.19ha Potential open space: 0.73ha Development area: 4.46ha  Potential no of dwellings: 104</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p>

	<p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>Access to the recreational route along the River Welland is approx. 930m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Spalding Common Community Hall and the closest playing field (Monk's House Playing Field) and health centre (Beechfield Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 229 people (2.2 occupants in each of the 104 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents. The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall, Spalding St Mary's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.73ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Mary's) showed that 78.2% of households owned at least one car (below the county average of 82%) and 42.9% travelled to work by car/van (just above the Lincolnshire average of 42.1%).</p> <p>The site is well within the ideal short driving (7km) distance to a big supermarket being around 2.5km from the Aldi store in Spalding (St Thomas's Road). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the site is outside the ideal 1km walking distance from a local shop and/or supermarket. Furthermore, there are no footways along Burr Lane and there are poor pedestrian and cycling links to the rest of Spalding from the site.</p>

	<p>Bicycles would have to share the existing highway network with motorists which may discourage cycle use. The site does not currently have a frontage onto a public highway meaning that adjacent land would need to be used in order to achieve a suitable access to the site.</p> <p>The potential for additional traffic to be generated by this site, as well as other sites nearby, means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops are on Hawthorne Bank, well outside the ideal 400m walking distance. Bus services currently operate hourly into Spalding Town Centre and to Peterborough (via Cowbit and Crowland).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Spalding St Mary's: Compared with the Lincolnshire average, its long term unemployment rate was above average (35.3% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (21.8% compared to 18%). However, crime rate per 1000 is just below the county average at 48.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA.</p> <p>If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. However, it is outside the ideal 1km walking distance. This could have a negative impact, potentially excluding access for some residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>

<b>5. Education</b>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 104 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 21 primary pupils and 20 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• St John the Baptist Church of England Primary School around 2.2km from the site</li> <li>• Spalding Grammar School (with 6<sup>th</sup> Form) approx. 2.3km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 2.7km away at the Red Lion Quarter.</p> <p>Spalding currently has a lack of capacity at primary and secondary level. If additional school places are needed to meet the needs of students living in the development, given the size of the site, it is expected that this would be delivered by the LEA, who will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>There are a number of trees within the site and its development would be likely to result in the loss of many of these. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>The site does not include any statutory designated sites, although it is in close proximity to a protected site being approx. 90m from the New River LWS. A Public Right of Way runs adjacent to the LWS meaning that there could be increased recreational pressure and footfall resulting from a larger population in the area which could have an adverse impact on the biodiversity within this protected site.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>Although the site is detached from the existing built-up area of Spalding, its development is unlikely to have an adverse impact on the character and appearance of the area. The site is largely screened from view along Barrier Bank by trees and vegetation and properties on Burr Lane and Fen End Lane help restrict its visual impact from the south.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>

<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 5.19ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and the vast majority is identified within the SFRA as 'danger for most', with small parts being 'low hazard' or 'no hazard'. There majority of the site has flood depths of 1.0-2.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is</p>

	<p>less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. Nonetheless, the anticipated increase in population (229 people) that development of this site is likely to generate means that new car journeys will be generated along with an increase in carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 229 people within the ideal 7km drive of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (229 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STP003: Former Jewsons Premises, Roman Bank, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 0.49ha Potential open space: 0.07ha Development area: 0.42ha  Potential no of dwellings: 63</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p>

	<p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>The recreational route along the River Welland is around 200m from the site. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest leisure centre (Castle Sports Complex), health centre (Beechfield Medical Centre) and community centre/village hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 139 people (2.2 occupants in each of the 63 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St. Paul's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the site area, about 0.07ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Paul's) showed that 73.3% of households owned at least one car whilst 37.2% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1%.</p> <p>The site is within the ideal short driving (7km) distance to a big supermarket being around 2.5km from the Aldi store in Spalding (St Thomas's Road). The site is also within the ideal 1km walking distance of a local shop being approx. 400m from the Londis Store (Commercial Road). Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Spalding should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p>

	<p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops around 200m from the site on Holbeach Road, within the ideal 400m walking distance. An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday) and there are also services to Kings Lynn (up to every 20 mins, 7 days a week) and The Deepings (five times a day during the week and thrice daily on a Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding St Paul's is a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was above average (31.8% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (26.7% compared to 18%) and that crime rate per 1000 is also above the county average at 53.9 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services and facilities are outside the ideal walking distances which may have an adverse impact on social inclusion. However, the nearest employment opportunities are at Springfields Retail Outlet (720m away) and are well within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 63 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 13 primary pupils and 12 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding St Pauls Community Primary School is around 560m from the site</li> <li>• Sir John Gleed School is approx. 1.4km away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 1.6km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the</p>

	<p>number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site is not likely to have an adverse impact on any trees or vegetation. However, the site is within approx. 20m of a protected site (River Welland LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity. It may be necessary to create a buffer between residential development and the river in order to minimize the likely adverse effects.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the development limits of Spalding and is surrounded by development.</p> <p>The site is currently unused having been cleared of its former use. As a result, redevelopment is likely to have a positive impact on townscape particularly in terms of reinstating a vibrant streetscene and development form in keeping with the surrounding residential properties. Such impact will, however, be dependent on implementation and design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p>

	<p>Water mains and sewers cross the site - these must remain accessible. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 0.49ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.49ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly 'danger for most' in terms of flood hazard, with the majority of the site having a flood depth of '1-2m', with a smaller part of the site at 0.5-1m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some of the areas facilities and services are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. However, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents but, given the size of the site, it is likely that an increased population (139 people) would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they</p>

	<p>reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 139 people within the ideal 7km drive and 1km walk of local employment opportunities.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (139 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>STP004: 80-89 Commercial Road, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario: Total site area: 0.16ha Potential no of dwellings: 14</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The recreational route along the River Welland is around 40m from the site and the nearest leisure centre (Castle Sports Complex) is approx. 480m away. The closest health centre (Beechfield Medical Centre) is 880m from the site, however there is no community centre within the preferred 600m walking distance.</p> <p>It is anticipated that the increase in population - approximately 31 people (2.2 occupants in each of the 14 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational</p>

	<p>facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St. Paul's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the potential number of dwellings, open space may be required. However, given the size of the site, it may be more usefully sought as a financial contribution to improve the quality and multifunctionality of existing open space in Spalding to accommodate future residents.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Paul's) showed that 73.3% of households owned at least one car whilst 37.2% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1%.</p> <p>The site is within the ideal short driving (7km) distance to a big supermarket being around 1.4km from the Lidl store in Spalding (Winover Centre). The site is also within the ideal 1km walking distance of a local shop being approx. 130m from the Londis Store (Commercial Road). Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops around 270m from the site near Ash Court, within the ideal 400m walking distance. An intertown bus service runs in Spalding with buses departing every 90 minutes, 6/7 times a day (Monday-Saturday) and there are also services to Kings Lynn (up to every 20 mins, 7 days a week) and The Deepings (five times a day during the week and thrice daily on a Saturday).</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding St Paul's is a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was above average (31.8% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (26.7% compared to 18%) and that crime rate per 1000 is also above the county average at 53.9 compared to 49.7.</p>

	<p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan. Furthermore, as discussed in Objective 13, the nearest employment opportunities are in Spalding Town Centre (740m away) and are well within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓/x</p> <p>The development would be likely to accommodate 14 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 3 primary pupils and 3 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding St Pauls Community Primary School is around 530m from the site</li> <li>• Sir John Gleed School is approx. 990m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 1.1km away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: right;">✓/x</p> <p>Development of the site may have an adverse impact on some trees/vegetation located within the gardens of existing dwellings. Furthermore, the site is within approx. 30m of a protected site (River Welland LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p>

	There is no significant geodiversity at this site - it is unlikely that a development will have an impact.
<b>7. Heritage</b>	0
	The site and surrounding area is not known to have any significant historic or culturally-significant features.
<b>8. Landscape and Townscape</b>	✓
	The site is within the development limits of Spalding and is surrounded by development. Development of the site is unlikely to have an adverse impact on the character and appearance of the area.
	Part of the site is currently used as a hand car wash. As a result, redevelopment is likely to have a positive impact on townscape particularly in terms of creating a development form in keeping with the surrounding residential properties. Such impact will, however, be dependent on implementation and design.
<b>9. Air, Soil and Water Resources</b>	✓
	Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.
	Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.
	New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.
	Sewers cross the site and must remain accessible at all times. The design of the site should take this into consideration.
	However this site does secure the redevelopment of 0.16ha of predominantly previously-developed land which could potentially see less best and most agricultural land being developed elsewhere.
<b>10. Sustainable use of Land and Waste</b>	✓
	The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.

	<p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.16ha of predominantly previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;"><b>x</b></p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with flood depths of '1.0 – 2.0m' across the majority of the site. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. Additionally, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;"><b>✓/x</b></p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 31 people within the ideal 7km drive and 1km walk of local employment.</p>

	<p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (31 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>
--	--

<b>STP005: Land to the east of Willow Row, Spalding</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 0.52ha Potential open space: 0.07ha Development area: 0.45ha            Potential no of dwellings: 16</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 5,510 dwellings proposed for Spalding over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Spalding and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The recreational route along the River Welland is around 90m from the site and the nearest leisure centre (Castle Sports Complex) is approx. 190m away. The closest health centre (Beechfield Medical Centre) is 510m from the site, however there is no community centre within the preferred 600m walking distance.</p> <p>It is anticipated that the increase in population - approximately 35 people (2.2 occupants in each of the 16 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups (CCGs) have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff. In the long term, a new GP surgery may be required to accommodate additional patients from the Spalding area and this will be reviewed with the CCGs and National Health Service England.</p> <p>Overall Spalding St. Paul's does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing their overall quality. Based on the potential number of dwellings, open space may be required. However, given the size of the site, it may be more usefully sought as a financial contribution to improve the quality and multifunctionality of existing open space in Spalding to accommodate future residents.</p>

	<p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Spalding St Paul's) showed that 73.3% of households owned at least one car whilst 37.2% travelled to work by car/van, below the Lincolnshire average of 82% and 42.1%.</p> <p>The site is within the ideal short driving (7km) distance to a big supermarket being around 1.1km from the Lidl store in Spalding (Winsover Centre). The site is also within the ideal 1km walking distance of a local shop being approx. 600m from the Londis Store (Commercial Road). Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own is not significant, but any traffic impact may be exacerbated by the potential cumulative impact of an increased local population generated from this site in combination with other sites in the town. Any impact should be carefully managed to not restrict access to jobs and services, and promote safe, easy use for all.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>The nearest bus stops around 530m from the site near Ash Court, outside the ideal 400m walking distance. An intertown bus service runs in Spalding with buses departing every 90 minutes.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics indicate that Spalding St Paul's is a deprived area: Compared with the Lincolnshire average, its long term unemployment rate was above average (31.8% compared to 25.6%). Furthermore, statistics show that the percentage of residents without access to a car is above average (26.7% compared to 18%) and that crime rate per 1000 is also above the county average at 53.9 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan. Furthermore, as discussed in Objective 13, the nearest employment opportunities are in Spalding Town Centre (460m away) and are well within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment.</p>

	<p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 16 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 3 primary pupils and 3 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Spalding St Pauls Community Primary School is around 1km from the site</li> <li>• Sir John Gleed School is approx. 870m away</li> </ul> <p>The site is also within the ideal walking distance to a post 18 education provider with Boston College (Spalding Campus) being approx. 770m away at the Red Lion Quarter.</p> <p>The local education authority has indicated that there is currently no capacity available in Spalding at primary level to accommodate the number of pupils new housing development is anticipated to generate. It is considered that capacity is available in the short term at secondary level and in the town's sixth forms but this is projected to be filled shortly after. Overall there is a requirement for a new primary, as well as a new secondary school (in the second phase of the plan).</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on some vegetation located within the site. Furthermore, the site is within approx. 70m of a protected site (River Welland LWS) and so development may have an effect on habitats and BAP species and consequently biodiversity.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">x</p> <p>Development of the site could have adverse impacts on the Spalding Conservation Area located adjacent to part of the south-eastern facing boundary of the site. Any such impacts could be prevented by careful design, particularly along this section of the boundary facing the Conservation Area.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is within the development limits of Spalding and is surrounded by predominantly residential development. Development of the site is unlikely to have an adverse impact on the characters and appearance of the area.</p>

	<p>Industrial buildings have been demolished on the site. As a result, redevelopment is likely to have a positive impact on townscape particularly in terms of creating a development form in keeping with the surrounding residential properties. Such impact will, however, be dependent on implementation and design. Given the former use, the redevelopment is also likely to have a positive impact on residential amenity.</p>
<p><b>9. Air, Soil and Water Resources</b></p>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Spalding area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Sewers cross the site and must remain accessible at all times. The design of the site should take this into consideration.</p> <p>However this site does secure the redevelopment of 0.52ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.52ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">x</p>

	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard, with flood depths of '1.0 – 2.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the area's services and facilities are within the ideal walking distances which could help minimise the need to travel by car. Additionally, as identified in Objective 3 and Objective 4, travel to work use by car and car ownership is lower here than for the rest of the county. This may lessen the effects of additional residents in terms of the number of new car journeys generated and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Spalding area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, there is very limited capacity in Spalding but they reinforcing the network over the short and mid-term which is likely to release capacity.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that, as one of the main locations for new development (housing and accompanying appropriate employment), Spalding will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. This site could have a positive impact on the local economy by bringing 35 people within the ideal 7km drive and 1km walk of local employment.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (35 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

## Main Service Centres: Crowland

CRO002: Land between 34-42 Peterborough Road, Crowland	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 1.86ha Potential open space: 0.26ha Development area: 1.6ha Potential no of dwellings: 37
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 524 dwellings proposed for the Crowland area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of housing to be constructed on this site can help deliver the housing need identified for Crowland and South East Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites partly within/adjacent to defined settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The nearest open space (Beccelm Drive) is within the ideal 1km walk (490m) of the site. However, other facilities that would help to maintain health and promote healthy lifestyles are over the ideal 1km walking distance (600m for a community/village hall). Abbeyview Health Centre, Snowden Playing Fields and the Royal British Legion centre are all outside this distance, although this is partly due to the design of the existing urban fabric.</p> <p>It is anticipated that the increase in population - approximately 81 people (2.2 occupants in each of the 37 dwellings) - associated with this site would put some pressure on the above existing facilities over the plan period. Additional/improved healthcare and sports facilities may be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Crowland does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.26ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Increased traffic generated by the development, both individually and cumulatively, is likely to lead to an increase in local air and noise pollution which could have a negative impact on physical and mental health.</p> <p>James Road runs along the south-western boundary which potentially could have a negative impact on physical and mental health.</p>

	Depth structural landscaping, such as trees and vegetation may need to be provided to mitigate impacts to create a satisfactory residential environment for future residents.
<b>3. Transport</b>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Crowland and Deeping St Nicholas) showed that 39.1% of households owned at least one car and 53.2% travelled to work by car/van, above the South Holland average of 45.8%.</p> <p>The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. But the site is outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. However the site is within the ideal 1km to a local convenience store (930m). Designing safe routes for pedestrians and cyclists from the site to Peterborough Road would help promote sustainable access for residents.</p> <p>There is expected to be some additional traffic generated by this site, individually and cumulatively; schemes to address traffic impact in and around Crowland should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand, increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. If the site were planned with legible and safe pedestrian and cycle routes from all parts of the site, it would have a positive effect upon promoting sustainable travel options.</p> <p>Bus services currently operate to Spalding and Peterborough; the nearest bus stops are within 320m of the site on Peterborough Road, meaning there is good access for residents. A public right of way is within 1km of the site improving access for future residents for local journeys.</p> <p>The site will not directly impact upon, or contribute towards, any major transport infrastructure in the area.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓</p> <p>Indices of Deprivation statistics (2015) indicate that Crowland &amp; Deeping St Nicholas is not within a deprived area. Even so, Policies 2 and 8 of the Local Plan proposes more housing and employment development in the Main Service Centres to contribute to a stronger local economy - additional housing that provides for a range of needs would, in general, support this approach.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing to ensure that development can help provide the infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>As discussed in Objective 13 Harvester Way (670m) is within the ideal walk 1km walk of the site and Horseshoe Yard is within a 4km drive of the site. Good design will better enable residents to use sustainable transport from the site to access local employment; physical access by sustainable transport to local employment opportunities could be improved through development of this site.</p>

	<p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p> <p>Superfast broadband is provided to Crowland; the site should be designed to enable easy connection for all homes, which will enable residents to access a range of facilities on line.</p>
<b>5. Education</b>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 37 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 7 primary pupils and 7 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Crowland South View Community Primary School: within 1.4km of the site</li> </ul> <p>However, there are no secondary school or post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that primary school provision in the town is limited and that an extension to the existing school is required to accommodate the number of pupils development in the area is anticipated to generate. Furthermore, the closest secondary school and sixth form facilities (The Deepings) are at capacity with additional capacity being required.</p> <p>Development on this site will generate employment during the construction period; apprenticeships or employment of local long term unemployed could help improve job prospects and prosperity for residents.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>No European, national or local environmental designations are near the site.</p> <p>The western area of this site is brownfield land and appears to have been left as 'semi wild' with mature trees and vegetation. Development may lead to their harm; good design could ensure any impacts are minimalised by careful layout or replacements planted through development. Care should be taken to ensure that no development occurs within the Root Protection Areas of the trees as calculated using British Standard 5837:2012.</p> <p>Mature trees, vegetation and several drainage channels run through the site and along the eastern boundary. They could provide space for the development (if not there at present) or enhancement (if already present) of multiple/various habitats which will support a range of BAP species. Ecosystem services could also be adversely affected; new development could potentially affect the water table and change the availability of ground water. The size of the site means that any direct damage and disturbance could be mitigated and betterment achieved through the provision of open space and/or structural landscaping, by using a mix of species, particularly of local provenance.</p>

	<p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sustainable drainage would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓/x</p> <p>The eastern part of the site lies within The Fens National Character Area; the flat, visually open, arable fields are typical landscape characteristics. Built development of this size, in this location would be well-contained, effectively providing an infill development between existing residential areas. James Road effectively provides a natural end to the built area – in particular by restricting views, and therefore any impact of the site, from the wider landscape. Good quality, structural landscaping would help reduce the landscape and visual impact, particularly from any sensitive receptors nearby. This would also help to mitigate potential pollution impacts of James Road identified in Objective 2 and integrate the development with the natural features that exist on site.</p> <p>The western part of the site is brownfield (former industrial buildings); redevelopment is likely to have a positive impact on townscape particularly in terms of reinstating a vibrant streetscene and development form in keeping with adjoining parts of Peterborough Road, and by completing the street frontage along Harrington Way. Such impact will, however, be dependent on implementation and design. Given the former use, the redevelopment is also likely to have a positive impact on residential amenity.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction would result in the generation of dust, the release of emissions from construction vehicles and the loss of trees. The extent to which air quality would be affected by development would depend upon mitigation to limit emissions and control dust during construction and the use of green infrastructure within the development. It is also likely that new housing development will increase traffic levels; with the current trend of car dependency likely to continue this could generate a negative impact on local air quality.</p> <p>Development could have some impact upon water quality during construction and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p>

	<p>Demand from the site may place a burden on the existing sewerage system - Anglian Water considers that the foul sewerage and water supply networks may require upgrading to serve the proposed growth or diversion of assets may be required. There is considered to be capacity available at Crowland's Water Recycling Centre. However, across South East Lincolnshire Anglian Water have commented that, in terms of the surface water network, there are major constraints to the provision of infrastructure and/or treatment. Water/sewerage infrastructure may cross the site. These should remain accessible to ensure their ongoing use and so the design of the site should take this into consideration.</p> <p>Development of this site involves an area identified as a former industrial site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 1.12 ha of Grade 2 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>During construction, the development will lead to the consumption of minerals, in the form of building materials. Sustainable waste management techniques should be used on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact will depend upon the design of new development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.12 ha of greenfield land.</p> <p>The site will safeguard minerals resources as it lies outside the minerals safeguarding zones.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and the majority is identified within the SFRA as 'danger for most' in terms of flood hazard, with a small part being 'danger for all'. The majority of the site has flood depths of 1.0-2.0m, with a small proportion being 0.5-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Crowland the plan period, and other benefits including enhancing the range of properties available and a positive impact on the local economy.</p>

	<p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: right;">✓/x</p> <p>As discussed above, this site is within a 20/25 minute walk of most local facilities, services and transport links. Even so, travel to work by car (53.2%) is higher than the rest of the County (42.1%) and for England (36.9%). It is therefore likely that the anticipated increase in 81 people would generate new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure that the travel patterns of new residents are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that new homes will be significantly more energy efficient than the older homes in Crowland. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy. Connection to the gas and electricity network is achievable.</p> <p>The inclusion of landscaping and green infrastructure within the development should have a positive effect upon carbon absorption particularly if a mix of species are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: right;">✓</p> <p>Indices of Deprivation statistics (2015) indicate that the site is not within a deprived neighbourhood in terms of income and employment deprivation. Even so, Crowland is a Main Service Centre; it is therefore likely that new development could have a positive impact on the local economy by bringing 81 people within the ideal 1km walk of Harvester Way and a 4km drive of Horseshoe Yard, as well as to new employment development that may take place over the plan period. This may have a positive impact in reducing unemployment (in 2015 its long term unemployment rate was 27.1% below the national level of 27.8%) and raising average wage levels. An additional 81 residents may also help support the primacy of Crowland town centre, generating income for its shops and services. Good design will better enable residents to use sustainable transport from the site to access local employment sites and the town centre.</p>

	Development will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).
<b>1. Transport</b>	✓/x

**CRO013: 10 Barbers Drove South, Crowland**

<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.11ha Potential no of dwellings: 2
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 524 dwellings proposed for the Crowland area over the plan period.
	The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of housing to be constructed on this site can help deliver the housing need identified for Crowland and South East Lincolnshire it will have a positive impact on this objective.
	Housing sites detached from defined settlement limits would, in general, be contrary to the principles of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓
	The nearest health centre (Abbeyview Health Centre) and playing fields (Snowden playing fields) are approx. 610m and 760m away respectively. The closest open space (Beccelm Drive) is around open space 870m away, within the ideal 1km walk of the site the site that would help to maintain health and promote healthy lifestyles. However, the Royal British Legion Centre is over the ideal 600m walk from a housing development for a village hall/community centre. Furthermore, this site is to the south east of James Road; the severance effect may mean that residents would not use sustainable transport to access such facilities.
	It is anticipated that the increase in population – an additional 4 people (2.2 occupants in each of the 34 dwellings) - associated with this site would put pressure on the above existing facilities over the life of the Plan. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used. But if the site is developed with the adjoining Cro032, Cro033 or Cro034 open space should be developed on site to better meet residents future recreational needs.
	The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.
	Overall, Crowland does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. If open space could be secured on-site through the planning process it would have a positive impact on this objective.
	Increased traffic generated by the development, individually and cumulatively with other development may slightly increase local air and noise pollution which could have a slight negative impact on physical and mental health.

	There are no bad neighbours nearby.
<b>3. Transport</b>	<p style="text-align: right;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Crowland and Deeping St Nicholas) shows that 39.1% of households owned at least one car and 53.2% travelled to work by car/van, above the South Holland average of 45.8%.</p> <p>The site is outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. Although the site is within the ideal 1km walk of a local convenience store (950m). This could have a positive effect upon promoting sustainable travel to Crowland’s shops and local facilities but James Road to the north west could act as severance which could discourage sustainable access.</p> <p>The potential traffic generated by this site individually and cumulatively means that schemes to address traffic impact in and around Crowland should ensure that any increase in traffic does not restrict access to jobs and services, and promote safe, easy use for all. Access to the site would be via Barbers Drove South; if the site were developed alongside Cro032, Cro033 or Cro034 an upgrade may be required to accommodate the traffic expected to be generated overall. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. Development of a larger site may enable sustainable transport options to be incorporated.</p> <p>Bus services currently operate to Spalding and Peterborough; the nearest bus stops are within 410m of the site on Peterborough Road, meaning that access for residents is acceptable. However the severance effect of James Road may discourage use. A public right of way is within the ideal 1km of the site meaning access to the countryside for recreation is good for residents.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: right;">✓/x</p> <p>Indices of Deprivation statistics (2015) indicate that Crowland &amp; Deeping St Nicholas is not within a deprived area: Even so, Policies 2 and 8 of the Local Plan proposes more housing and employment development in the Main Service Centres to contribute to a stronger local economy – but as the additional housing is detached from Crowland settlement boundary this site would not support this approach.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. Quality market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents. The size of the site means that affordable housing (as part of a market housing scheme) would not be able to be secured.</p> <p>As discussed in Objective 13 Horseshoe Yard (1km) is within the ideal 1km walk and Harvester Way (1.1km) is within the ideal 7km drive of the site. Safe access for cycling/walking will better enable residents to use sustainable transport to access local employment.</p>

	<p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p> <p>Superfast broadband is provided to Crowland; as the site is detached from Crowland an upgrade may be required to enable easy connection for all homes, which will enable residents to access a range of facilities on line.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 2 dwellings and so it is anticipated that few pupils will live on the site. The nearest primary school is:</p> <ul style="list-style-type: none"> <li>• Crowland South View Community Primary School approx 1.1km from the site</li> </ul> <p>However, there are no secondary school or post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>Crowland currently requires additional capacity for primary, secondary and post-16 provision. Additional school places will therefore be needed to meet the needs of students living in the development; contributions may be sought to help address the negative impact generated by this development. The LEA will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period; apprenticeships or employment of local long-term unemployed could help improve job prospects and prosperity for residents.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>No European or national environmental designations are near to the site.</p> <p>Mature trees and other vegetation exist on the site. Development may lead to the loss of mature trees; good design could ensure any impacts are minimised by careful layout or replacements planted through development. Care should be taken to ensure that no development occurs within the Root Protection Areas of the trees as calculated using British Standard 5837:2012.</p> <p>These could provide space for the development (if not there at present) or enhancement (if already present) of multiple habitats which could support a range of BAP species. Ecosystem services could also be adversely affected; new development could potentially affect the water table and change the availability of ground water. The size of the site means that direct damage and disturbance could happen. The use of structural landscaping may help minimise adverse impacts.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11 sustainable drainage would be beneficial to meet the needs of the development.</p>

<b>7. Heritage</b>	0
	The site and surrounding area does not have any significant historic or culturally-significant features.
<b>8. Landscape and Townscape</b>	✓
	The site is part of a ribbon development of residential properties fronting Barbers Drove South. The size of the site means that development will remain in line with the existing depth of development which should minimise landscape impacts. Part of the site is brownfield containing a former agricultural yard; redevelopment is likely to have a positive impact on townscape by creating a frontage and streetscene consistent with the adjoining existing residential environment. However the impact upon townscape will depend upon design and implementation.
<b>9. Air, Soil and Water Resources</b>	x
	<p>Development would inevitably have some effect upon air quality. The construction would result in the generation of dust, the release of emissions from construction vehicles and the loss of trees. The extent to which air quality would be affected by development would depend upon mitigation to limit emissions and control dust during construction and the use of green infrastructure within the development. It is also likely that new housing development will increase traffic levels; with the current trend of car dependency likely to continue this could generate a negative impact on local air quality.</p> <p>Development could have some impact upon water quality during construction and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network can be achieved although the sewerage network may require an upgrade to accommodate foul water.</p> <p>The proposal would lead to the permanent loss of 0.09 ha of grade 2 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	x
	<p>The development will lead to the consumption of minerals in the form of some building materials in the construction. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be a slight increase in household waste production.</p> <p>The proposal would lead to the permanent loss of 0.09 ha of greenfield land.</p> <p>The site will safeguard minerals resources as it lies outside the minerals safeguarding zones.</p>
<b>11. Flood Risk</b>	x

	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'danger for most' in terms of flood hazard and flood depths of 1.0-2.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓</p> <p>As discussed above, this site is within a 15/20 minute walk of most local facilities, services and transport links. Even so, travel to work by car (53.2%) is higher than the rest of the County (42.1%) and for England (36.9%). It is likely that the anticipated increase of 4 people would generate a significant number of new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that new homes built will be significantly more energy efficient than the older homes in Crowland. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy. An upgrade may be required to accommodate the level of development identified, for gas and electricity.</p> <p>The inclusion of landscaping and green infrastructure within the development should have a positive effect upon carbon absorption particularly if a mix of species is used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓</p> <p>Indices of Deprivation statistics (2015) indicate that the site does not lie within a deprived neighbourhood in terms of income and employment deprivation. But as Crowland is a Main Service Centre it is therefore likely that new development could have a positive impact on the local economy by bringing 4 people within the ideal 1km walk/cycle of Horseshoe Yard (1km) and the ideal 7km drive of Harvester Way (1.1km) as well as to new employment development that may take place over the plan period. This may have a positive impact in reducing unemployment and raising average wage levels. An additional 4 residents may also help support the primacy of Crowland town centre, generating income for its shops and services. Good design will better enable residents to use sustainable transport from the site to access local employment sites and the town centre.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (4 people) is likely to mean that traffic will be generated by this site. Schemes to minimise traffic impact in the area and enable sustainable transport will need to be considered in order to ensure that impact on the local road network do not worsen and are detrimental to the economy.</p>

<b>CRO020: Former Industrial Premises, East of Peterborough Road, Crowland</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.27ha Potential no of dwellings: 5
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 524 dwellings proposed for Crowland over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Crowland and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Furthermore, housing sites within the defined settlement limits of Crowland would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓</p> <p>The majority of facilities and service that would help to maintain health and promote healthy lifestyles are within the ideal walking distances. The nearest open space and playing fields (Stricklands Drive) and health centre (Abbeyview Health Centre) are approx. 450m and 840m away respectively, within the preferred 1km distance. Furthermore, the closest village hall/community centre (Royal British Legion Centre) is around 380m away, within the ideal 600m distance.</p> <p>It is anticipated that the increase in population - approximately 11 people (2.2 occupants in each of the 5 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used. However should the site be developed with the adjoining Cro044 open space provision should be developed on site to better meet resident's future recreational needs.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Increased traffic generated by the development is likely to slightly increase local air and noise pollution which could have a negative impact on physical and mental health.</p> <p>There are no bad neighbours nearby.</p>
<b>3. Transport</b>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Crowland and Deeping St Nicholas) shows that 39.1% of households owned at least one car and 53.2% travelled to work by car/van, above the South Holland average of 45.8%.</p> <p>The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping</p>

	<p>needs. But the site is outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. However the site is within the ideal 1km of a local convenience store (630m) which could have a positive effect upon promoting sustainable travel to Crowland’s shops and local facilities. Designing safe access for pedestrians and cyclists from the site to Peterborough Road would help promote sustainable access for residents.</p> <p>The potential traffic generated by this site individually and cumulatively means that schemes to address traffic impact in and around Crowland should ensure that any increase in traffic does not restrict access to jobs and services, and promote safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. Good design will better enable sustainable transport options to be incorporated and available to residents throughout the site.</p> <p>Bus services currently operate to Spalding and Peterborough; the nearest bus stops are within 160m of the site on Peterborough Road, meaning access to public transport is easy for residents. A public right of way is 270m from the site providing good access for recreation for residents.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>Indices of Deprivation statistics (2015) indicate that Crowland &amp; Deeping St Nicholas is not within a deprived area. Even so, Policies 2 and 8 of the Local Plan proposes more housing and employment development in the Main Service Centres to contribute to a stronger local economy - additional housing within the Crowland settlement boundary would support this approach.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents. The size of the scheme means that affordable housing (as part of a market housing scheme) would not be able to be secured.</p> <p>As discussed in Objective 13 Horseshoe Yard (640m) and Harvester Way (1.0km) are within the ideal walk 1km walk of the site. Good design will better enable residents to use sustainable transport options through and from the site to access local employment. Therefore the site could improve physical access to local employment opportunities.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p> <p>Superfast broadband is provided to Crowland; an extension may be required to enable easy connection for all homes, which will enable residents to access a range of facilities on line.</p>

<b>5. Education</b>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 5 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil. The nearest primary school is:</p> <ul style="list-style-type: none"> <li>• Crowland South View Community Primary School approx 1km from the site</li> </ul> <p>However, there are no secondary school or post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>Crowland currently requires additional capacity for primary, secondary and post-16 provision. Additional school places will therefore be needed to meet the needs of students living in the development; contributions may be sought to help address the negative impact generated by this development. The LEA will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period; apprenticeships or employment of local long-term unemployed could help improve job prospects and prosperity for residents.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>No European, national or local environmental designations are near to the site.</p> <p>Although there are no trees or vegetation on site, the site is brownfield land. This could provide space for the development (if not there at present) or enhancement (if already present) of multiple habitats which could support a range of BAP species. Ecosystem services could also be adversely affected; new development could potentially affect the water table and change the availability of ground water. The size of the site means that any direct damage and disturbance may not be mitigated on-site although structural landscaping, particularly a mix of species, could achieve betterment.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11 sustainable drainage would be beneficial to meet the needs of the development.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>The site and surrounding area does not have any significant historic or culturally-significant features.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓/x</p> <p>The site is brownfield (former industrial buildings), redevelopment is likely to have a positive impact on townscape particularly in terms of reinstating a streetscene and development form in keeping with adjoining residential areas along Peterborough Road. Such impact will, however, be dependent on implementation and design. Given the former use, the redevelopment is also likely to have a positive impact on residential amenity.</p> <p>There will be no impact on landscape.</p>

<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction would result in the generation of dust and the release of emissions from construction vehicles. The extent to which air quality would be affected by development would depend upon mitigation to limit emissions and control dust during construction and the use of green infrastructure within the development. It is also likely that new housing development will increase traffic levels; with the current trend of car dependency likely to continue this could generate a negative impact on local air quality.</p> <p>Development could have some impact upon water quality during construction and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network can be achieved although the sewerage network may require an upgrade to accommodate foul water.</p> <p>Development of this site involves an area identified as a former road haulage site meaning that there are likely to be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance soil resources.</p> <p>This site does secure the redevelopment of 0.27ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>This site does secure the redevelopment of 0.27ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>The site will safeguard minerals resources as it lies outside the minerals safeguarding zones.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 2 and is identified within the SFRA as a combination of 'danger for some' (which is much of the site), 'low hazard', 'danger for most' and 'no hazard' in terms of flood hazard. Flood depths vary across the site from no depth up to 0.5-1.0m, although the majority of the site is 0.25-5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p>

	<p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, development of the site would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Crowland for the plan period; improving health and wellbeing; promoting strong, secure, socially inclusive and cohesive communities; and other benefits including providing some protection to the local economy.</p> <p>A Flood Risk Assessment should ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere, and, should where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Reference should be made to the South East Lincolnshire Strategic Flood Risk Assessment and the NPPG.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used, and through green infrastructure; natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>As discussed above, this site is within a 15 minute walk of most local facilities, services and transport links. Even so, as travel to work by car (53.2%) is higher than the rest of the County (42.1%) and for England (36.9%) it is likely that the anticipated increase of 11 people would generate an additional number of new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Crowland. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy. It is expected that the development could be accommodated within the gas and electricity network.</p> <p>The inclusion of landscaping and green infrastructure within the development should have a positive effect upon carbon absorption</p>

	particularly if a mix of species are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓✓
	Indices of Deprivation statistics (2015) indicate that the site does not lie within a deprived neighbourhood in terms of income and employment deprivation in the UK. But as Crowland is a Main Service Centre it is therefore likely that new development could have a positive impact on the local economy by bringing 11 people within the ideal 1km walk/cycle of Harvester Way (1km) and Horseshoe Yard (640m) as well as to new employment development that may take place over the plan period. This may have a positive impact in reducing unemployment and raising average wage levels. An additional 11 residents may also help support the primacy of Crowland town centre, generating income for its shops and services. Good design will better enable residents to use sustainable transport from the site to access local employment sites and the town centre.
	Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).

<b>CRO023: 65 Peterborough Road, Crowland</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.19ha Potential no of dwellings: 3
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 524 dwellings proposed for Crowland over the plan period.
	The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Crowland and SE Lincolnshire it will have a positive impact on this objective.
	Furthermore, housing sites within the defined settlement limits of Crowland would, in general, be more important to the delivery of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓/x
	The nearest open space (Beccelm Drive) and playing field (Snowden Playing Fields) are approx. 380m and 880m away respectively. However, other facilities and services that would help to maintain health and promote healthy lifestyles are over 1km (600m for a community/village hall), the ideal distance from housing development. Both Abbeyview Health Centre and the Royal British Legion Centre are outside these distances.
	It is anticipated that the increase in population - approximately 7 people (2.2 occupants in each of the 3 dwellings) - associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.
	The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff

	<p>which could affect future capacity should demand increase.</p> <p>Increased traffic generated by the development is likely to slightly increase local air and noise pollution which could have a slight negative impact on physical and mental health.</p> <p>There are no bad neighbours nearby.</p>
<b>3. Transport</b>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Crowland and Deeping St Nicholas) shows that 39.1% of households owned at least one car and 53.2% travelled to work by car/van, above the South Holland average of 45.8%.</p> <p>The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. But the site is outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. However the site is within the ideal 1km walk/cycle of a local convenience store which could have a positive impact upon promoting sustainable travel to Crowland’s shops and local facilities. Ensuring safe access for pedestrians and cyclists from the site to Peterborough Road would help promote sustainable access for residents.</p> <p>The potential traffic generated by this site individually and cumulatively means that schemes to address traffic impact in and around Crowland should ensure that any increase in traffic does not restrict access to jobs and services, and promote safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. Good design will better enable sustainable transport to be available to residents throughout the site.</p> <p>Bus services currently operate to Spalding and Peterborough; the nearest bus stops are within 50m of the site on Peterborough Road, meaning access to public transport is easy for residents. A public right of way is 290m from the site providing good access for recreation for residents.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓</p> <p>Indices of Deprivation statistics (2015) indicate that Crowland &amp; Deeping St Nicholas is not within a deprived area. Even so, Policies 2 and 8 of the Local Plan proposes more housing and employment development in the Main Service Centres to contribute to a stronger local economy - additional housing within the Crowland settlement boundary would support this approach.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents. The size of the scheme means that affordable housing (as part of a market housing scheme) would not be able to be secured.</p>

	<p>As discussed in Objective 13 Harvester Way (580m) is within the ideal 1km walk/cycle and Horseshoe Yard (1.1km) is within the ideal 7km drive of the new development. Good design will better enable residents to use sustainable transport to access local employment. Therefore the site could improve physical access to local employment opportunities.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p> <p>Superfast broadband is provided to Crowland; an extension may be required to enable easy connection for all homes, which will enable residents to access a range of facilities on line.</p>
<b>5. Education</b>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 3 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The nearest primary school is:</p> <ul style="list-style-type: none"> <li>• Crowland South View Community Primary School approx 1.5km from the site</li> </ul> <p>However, there are no secondary school or post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>Crowland currently requires additional capacity for primary, secondary and post-16 provision. Additional school places will therefore be needed to meet the needs of students living in the development; contributions may be sought to help address the negative impact generated by this development. The LEA will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period; apprenticeships or employment of local long-term unemployed could help improve job prospects and prosperity for residents.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>No European, national or local environmental designations are near to the site.</p> <p>The western area of this site contains some mature trees and an area of protected mature trees adjoins the site to the south. Development may lead to the loss of the trees; good design could ensure any impacts are minimalised by careful layout or replacements planted through development. Care should be taken to ensure that no development occurs within the Root Protection Areas of the trees as calculated using British Standard 5837:2012.</p> <p>Other vegetation exists on site. This could provide space for the development (if not there at present) or enhancement (if already present) of multiple habitats which could support a range of BAP species. Ecosystem services could also be adversely affected; new development could potentially affect the water table and change the availability of ground water. The size of the site means that any</p>

	<p>direct damage and disturbance may not be mitigated on-site although structural landscaping, particularly a mix of species, could achieve betterment.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11 sustainable drainage would be beneficial to meet the needs of the development.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>The site and surrounding area does not have any significant historic or culturally-significant features.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓/x</p> <p>The eastern part of the site is brownfield land and so redevelopment should promote a positive impact on townscape particularly in terms of continuing a streetscene that is in keeping with adjoining parts of Peterborough Road. The remaining 0.12ha of the site is greenfield land, although some may be re-used as gardens it is unlikely it will be returned to greenfield use. Overall, the impact on townscape will, depend on implementation and design.</p> <p>There will be no impact on landscape.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction would result in the generation of dust, the release of emissions from construction vehicles and the loss of trees. The extent to which air quality would be affected by development would depend upon mitigation to limit emissions and control dust during construction and the use of green infrastructure within the development. It is also likely that new housing development will increase traffic levels; with the current trend of car dependency likely to continue this could generate a negative impact on local air quality.</p> <p>Development could have some impact upon water quality during construction and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network can be achieved although the sewerage network may require an upgrade to accommodate foul water.</p> <p>This site does secure the redevelopment of 0.07ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p>

	<p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>This site does secure the redevelopment of 0.07ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>The site will safeguard minerals resources as it lies outside the minerals safeguarding zones.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and most of it is identified within the SFRA as 'danger for most' in terms of flood hazard, with a smaller part being 'danger for all'. Flood depths vary across the site from 0.5-1.0m up to 1.0-2.0m, but the majority of the site is the former. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Crowland for the plan period, and other benefits including improving accessibility to local services, promoting a cohesive community, reducing unemployment and raising average wage levels.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	✓/x

	<p>As discussed above, this site is within a 20/25 minute walk of most local facilities, services and transport links Even so, as travel to work by car (53.2%) is higher than the rest of the County (42.1%) and for England (36.9%) it is likely that the anticipated increase of 7 people would generate an additional number of new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Crowland. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy. It is expected that the development could be accommodated within the gas and electricity network.</p> <p>The inclusion of landscaping and green infrastructure within the development should have a positive effect upon carbon absorption particularly if a mix of species are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓
	<p>Indices of Deprivation statistics (2015) indicate that the site does not lie within a deprived neighbourhood in terms of income and employment deprivation. But as Crowland is a Main Service Centre it is therefore likely that new development could have a positive impact on the local economy by bringing 7 people within the ideal 1km walk/cycle of Harvester Way (580m) and the ideal 7km drive of Horseshoe Yard (1.1km) as well as to new employment development that may take place over the plan period. This may have a positive impact in reducing unemployment and raising average wage levels. An additional 7 residents may also help support the primacy of Crowland town centre, generating income for its shops and services. Good design will better enable residents to use sustainable transport from the site to access local employment sites and the town centre.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p>

<b>CRO025: Land at Alderlands Close, Crowland</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.21ha Potential no of dwellings: 1
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 524 dwellings proposed for Crowland over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Crowland and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Furthermore, housing sites within the defined settlement limits of Crowland would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-</b>	✓✓

<p><b>being</b></p>	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within the ideal 1km walking distance (600m for a community centre/village hall). The Royal British Legion Centre and the nearest open space and playing fields (Stricklands Drive) are approx. 490m and 550m away respectively. Furthermore, the closest health centre (Abbeyview Health Centre) is around 750m from the site.</p> <p>It is anticipated that the increase in population - approximately 2 people (2.2 occupants in each dwelling) - associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Increased traffic generated by the development is likely to slightly increase local air and noise pollution which could have a slight negative impact on physical and mental health.</p> <p>There are no bad neighbours nearby.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Crowland and Deeping St Nicholas) shows that 39.1% of households owned at least one car and 53.2% travelled to work by car/van, above the South Holland average of 45.8%.</p> <p>The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. But the site is outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. However the site is within the ideal 1km of a local convenience store (730m) which could have a positive impact upon promoting sustainable travel to Crowland's shops and local facilities. Ensuring safe access for pedestrians and cyclists from the site to Peterborough Road would help promote sustainable access for residents.</p> <p>The potential traffic generated by this site individually and cumulatively means that schemes to address traffic impact in and around Crowland should ensure that any increase in traffic does not restrict access to jobs and services, and promote safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. Good design will better enable sustainable transport to be available to residents throughout the site.</p> <p>Bus services currently operate to Spalding and Peterborough; the nearest bus stops are within 50m of site on Peterborough Road, meaning access to public transport is easy for residents. A public right of way runs along the southern boundary meaning access for recreation for residents is good.</p>

	The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓✓</p> <p>Indices of Deprivation statistics (2015) indicate that Crowland &amp; Deeping St Nicholas is not within a deprived area. Even so, Policies 2 and 8 of the Local Plan proposes more housing and employment development in the Main Service Centres to contribute to a stronger local economy - additional housing within the Crowland settlement boundary would support this approach.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. Quality market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents. The size of the scheme means that affordable housing (as part of a market housing scheme) would not be able to be secured.</p> <p>As discussed in Objective 13 Harvester Way (850m) and Horseshoe Yard (770m) are within the ideal 1km walk/cycle of the new development. Therefore the site could improve physical access to local employment opportunities.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p> <p>Superfast broadband is provided to Crowland; an extension may be required to enable easy connection for all homes, which will enable residents to access a range of facilities on line.</p>
<b>5. Education</b>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 1 dwelling. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The nearest primary school is:</p> <ul style="list-style-type: none"> <li>• Crowland South View Community Primary School approx 1.2km from the site</li> </ul> <p>However, there are no secondary school or post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>Crowland currently requires additional capacity for primary, secondary and post-16 provision. Additional school places will therefore be needed to meet the needs of students living in the development; contributions may be sought to help address the negative impact generated by this development. The LEA will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period; apprenticeships or employment of local long-term</p>

	unemployed could help improve job prospects and prosperity for residents.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>No European, national or local environmental designations are near to the site.</p> <p>This brownfield site appears to have been left as 'semi wild' with trees evident. Development may lead to the loss of the trees; good design could ensure any impacts are minimised by careful layout or replacements planted through development. Care should be taken to ensure that no development occurs within the Root Protection Areas of the trees as calculated using British Standard 5837:2012.</p> <p>Other vegetation exists on site. This could provide space for the development (if not there at present) or enhancement (if already present) of multiple habitats which could support a range of BAP species. Ecosystem services could also be adversely affected; new development could potentially affect the water table and change the availability of ground water. The size of the site means that any direct damage and disturbance may not be mitigated on-site although structural landscaping, particularly a mix of species, could achieve betterment.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11 sustainable drainage would be beneficial to meet the needs of the development.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>The site and surrounding area does not have any significant historic or culturally-significant features.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓/x</p> <p>The site is brownfield (former industrial use) and so redevelopment should promote a positive impact on townscape particularly in terms of continuing a streetscene that is in keeping with adjoining parts of Peterborough Road. Such impact will, however, be dependent on implementation and design.</p> <p>Given the former use, the redevelopment is also likely to have a positive impact on residential amenity.</p> <p>There will be no impact on landscape.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction would result in the generation of dust, the release of emissions from construction vehicles and the loss of trees. The extent to which air quality would be affected by development would depend upon mitigation to limit emissions and control dust during construction and the use of green infrastructure within the development. It is also likely that new housing development will increase traffic levels; with the current trend of car dependency likely to continue this could generate a negative impact on local air quality.</p> <p>Development could have some impact upon water quality during construction and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p>

	<p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network can be achieved although the sewerage network may require an upgrade to accommodate foul water.</p> <p>Development of this site involves an area identified as a former industrial site meaning that there are likely to be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance soil resources.</p> <p>This site does secure the redevelopment of 0.21ha of previously-developed land which could see less best and most versatile agricultural land being developed elsewhere.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>This site does secure the redevelopment of 0.21ha of previously-developed land which could see less greenfield land being developed elsewhere.</p> <p>The site will safeguard minerals resources as it lies outside the minerals safeguarding zones.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zones 2 and 3a and is identified within the SFRA as ‘no hazard’ in terms of flood hazard and depth in terms of flood hazard and depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, development of the site would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Crowland for the plan period; improving health and wellbeing; promoting sustainable transport and strong, secure, socially inclusive and cohesive communities; and other benefits including providing some protection to the local economy.</p>

	<p>A Flood Risk Assessment should ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere, and, should where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Reference should be made to the South East Lincolnshire Strategic Flood Risk Assessment and the NPPG.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used, and through green infrastructure; natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓</p> <p>As discussed above, this site is within a 10/15 minute walk of most local facilities, services and transport links. Even so, as travel to work by car (53.2%) is higher than the rest of the County (42.1%) and for England (36.9%) it is likely that the anticipated increase of 2 people would generate a minimal additional number of new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Crowland. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy. It is expected that the development could be accommodated within the gas and electricity network.</p> <p>The inclusion of landscaping and green infrastructure within the development should have a positive effect upon carbon absorption particularly if a mix of species are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓✓</p> <p>Indices of Deprivation statistics (2015) indicate that the site does not lie within a deprived neighbourhood in terms of income and employment deprivation. But as Crowland is a Main Service Centre it is therefore likely that new development could have a positive impact on the local economy by bringing 2 people within the ideal 1km walk/cycle of Harvester Way (850m) and Horseshoe Yard (770m) as well as to new employment development that may take place over the plan period. This may have a positive impact in reducing unemployment and raising average wage levels. An additional 2 residents may also help support the primacy of Crowland town centre, generating income for its shops and services. Good design will better enable residents to use sustainable transport from the site to access local employment sites and the town centre.</p>

	Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).
--	--

<b>CRO028: Former PO Sorting Office, 6A Reform Street, Crowland</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.2ha Potential no of dwellings: 1
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 524 dwellings proposed for Crowland over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Crowland and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Furthermore, housing sites within the defined settlement limits of Crowland would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓✓
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within the ideal 1km walking distance (600m for a community centre/village hall). The Royal British Legion Centre and the nearest open space and playing fields (Stricklands Drive) are approx. 230m and 380m away respectively. The closest health centre (Abbeyview Health Centre) is around 540m from the site.</p> <p>It is anticipated that the increase in population - approximately 2 people (2.2 occupants in each dwelling) - associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. <b>3. Transport</b>	✓
	It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Crowland and Deeping St Nicholas) shows that 39.1% of households owned at least one car and 53.2% travelled to work by car/van, above the South Holland

	<p>average of 45.8%.</p> <p>The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. But the site is outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. However the site is within the ideal 1km of a local convenience store (110m) which could have a positive impact upon promoting sustainable travel to Crowland’s shops and local facilities. Ensuring safe access for pedestrians and cyclists from the site to Chapel Street would help promote sustainable access for residents.</p> <p>The potential traffic generated by this site individually and cumulatively means that schemes to address traffic impact in and around Crowland should ensure that any increase in traffic does not restrict access to jobs and services, and promote safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. Good design will better enable sustainable transport to be available to residents throughout the site.</p> <p>Bus services currently operate to Spalding and Peterborough; the nearest bus stops are within 260m of the site on Broadway, meaning access to public transport is good for residents. A public right of way is within 210m of the site meaning access for recreation for residents is good.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>Indices of Deprivation statistics (2015) indicate that Crowland &amp; Deeping St Nicholas is not within a deprived area. Even so, Policies 2 and 8 of the Local Plan proposes more housing and employment development in the Main Service Centres to contribute to a stronger local economy - additional housing within the Crowland settlement boundary would support this approach.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. Quality market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents. The size of the scheme means that affordable housing (as part of a market housing scheme) would not be able to be secured.</p> <p>As discussed in Objective 13 Horseshoe Yard (490m) and Harvester Way (910m) are within the ideal 1km walk/cycle of the site. Therefore the site could improve physical access to local employment opportunities.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p> <p>Superfast broadband is provided to Crowland; an extension may be required to enable easy connection for all homes, which will</p>

	enable residents to access a range of facilities on line.
<b>5. Education</b>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 1 new dwelling. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The nearest primary school is:</p> <ul style="list-style-type: none"> <li>• Crowland South View Community Primary School approx 520m from the site</li> </ul> <p>However, there are no secondary school or post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>Crowland currently requires additional capacity for primary, secondary and post-16 provision. Additional school places will therefore be needed to meet the needs of students living in the development; contributions may be sought to help address the negative impact generated by this development. The LEA will continue to review school place provision annually. This will inform any scheme should it come forward for development. The local education authority has indicated that primary school provision in the town is limited and that an extension to the existing school is required to accommodate the number of pupils development in the area is anticipated to generate. Furthermore, the closest secondary school and sixth form facilities (The Deepings) are at capacity with additional capacity being required.</p> <p>Development on this site will generate employment during the construction period; apprenticeships or employment of local long-term unemployed could help improve job prospects and prosperity for residents.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>No European, national or local environmental designations are near to the site.</p> <p>A hedgerow and vegetation exists on site. This could provide space for the development (if not there at present) or enhancement (if already present) of multiple habitats which could support a range of BAP species. Ecosystem services could also be adversely affected; new development could potentially affect the water table and change the availability of ground water. The size of the site means that any direct damage and disturbance may not be mitigated on-site although structural landscaping, particularly a mix of species, could achieve betterment.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11 sustainable drainage would be beneficial to meet the needs of the development.</p>
<b>7. Heritage</b>	<p style="text-align: center;">✓/x</p> <p>Buildings of local historic interest adjoin the site. Development may adversely affect the significance, character and setting of these heritage assets. The site also lies within the Crowland Conservation Area. The impact of the development of this site, positive or negative on heritage assets will be highly dependent upon quality design and implementation, and the recommendations of a Statement of Significance.</p>
<b>8. Landscape and</b>	<p style="text-align: center;">✓/x</p>

<b>Townscape</b>	<p>The site is brownfield land and so redevelopment is likely to have a positive impact on townscape particularly in terms of creating a form of development appropriate to a historic residential environment. As discussed in Objective 7 any impacts will be dependent on implementation and design.</p> <p>Given the former use, the redevelopment is also likely to have a positive impact on residential amenity.</p> <p>There will be no impact on landscape.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction would result in the generation of dust, the release of emissions from construction vehicles and the loss of trees. The extent to which air quality would be affected by development would depend upon mitigation to limit emissions and control dust during construction and the use of green infrastructure within the development. It is also likely that new housing development will increase traffic levels; with the current trend of car dependency likely to continue this could generate a negative impact on local air quality.</p> <p>Development could have some impact upon water quality during construction and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network can be achieved although the sewerage network may require an upgrade to accommodate foul water.</p> <p>Development of this site involves an area of filled land meaning that there are likely to be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance soil resources.</p> <p>However this site does secure the redevelopment of 0.2ha of previously-developed land which could potentially see less best and most versatile agricultural land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">✓</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 0.2ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>The site will safeguard minerals resources as it lies outside the minerals safeguarding zones.</p>

<b>11. Flood Risk</b>	<p style="text-align: right;">✓✓</p> <p>This site is within Environment Agency Flood Zone 1 (no hazard, no depth). This means that the site is within a sequentially preferable location in terms of flood risk so generates a positive impact.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used, and through green infrastructure; natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: right;">✓/x</p> <p>As discussed above, this site is within a 10/15 minute walk of most local facilities, services and transport links. Even so, as travel to work by car (53.2%) is higher than the rest of the County (42.1%) and for England (36.9%) it is likely that the anticipated increase of 2 people would generate a minimal additional number of new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Crowland. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy. It is expected that the development could be accommodated within the gas and electricity network.</p> <p>The inclusion of landscaping and green infrastructure within the development should have a positive effect upon carbon absorption particularly if a mix of species are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: right;">✓✓</p> <p>Indices of Deprivation statistics (2015) indicate that the site does not lie within a deprived neighbourhood in terms of income and employment deprivation. But as Crowland is a Main Service Centre it is therefore likely that new development could have a positive impact on the local economy by bringing 2 people within the ideal 1km walk/cycle of Horseshoe Yard (490m) and Harvester Way (910m) as well as to new employment development that may take place over the plan period. This may have a positive impact in reducing unemployment and raising average wage levels. An additional 2 residents may also help support the primacy of Crowland town centre, generating income for its shops and services. Good design will better enable residents to use sustainable transport from the site to access local employment sites and the town centre.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p>

<b>CRO031: Land off Clout Drove, Crowland</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 8.41ha Potential open space: 1.18ha Development area: 7.23ha Potential no of dwellings: 168
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 524 dwellings proposed for Crowland over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Crowland and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Furthermore, housing sites adjacent to the defined settlement limits of Crowland would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The nearest open space (off Burghley Close/Jubilee Way) is approx. 430m from the site. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are over 1km away (600m for a community centre/village hall), the ideal walking distance from housing development. Abbeyview Health Centre, Snowden Playing Fields and the Royal British Legion Centre are all outside the ideal distances.</p> <p>It is anticipated that the increase in population - approximately 370 people (2.2 occupants in each of the 168 dwellings) - associated with this site would put pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Crowland does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 1.18ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Increased traffic generated by the development is likely to increase local air and noise pollution which could have a negative impact on physical and mental health.</p> <p>An electricity sub-station adjoins the site to the north which potentially could have a negative impact on physical and mental health. Depth structural landscaping, such as trees and vegetation would need to be provided to provide adequate mitigation to create a satisfactory residential environment for future residents.</p>
<b>3. Transport</b>	x

	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Crowland and Deeping St Nicholas) shows that 39.1% of households owned at least one car and 53.2% travelled to work by car/van, above the South Holland average of 45.8%.</p> <p>The site is outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the site is also outside the ideal 1km walk of a local convenience store being approx. 1.2km from the Spar store in the town meaning that residents would be less likely to use more sustainable modes of transport to meet their everyday shopping needs.</p> <p>The potential traffic generated by this site individually and cumulatively means that schemes to address traffic impact in and around Crowland should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable transport, particularly for local journeys. Good masterplanning will better enable sustainable transport options to be incorporated and available to residents throughout the site.</p> <p>Bus services currently operate to Spalding and Peterborough from Crowland. However, the nearest bus stops are outside the ideal 400m walking distance meaning that residents would have limited access to bus services. A public right of way is within the ideal 1km of the site meaning access to the countryside for recreation is good for residents.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">x</p> <p>Indices of Deprivation statistics (2015) indicate that Crowland &amp; Deeping St Nicholas is not a deprived area. Even so, Policies 2 and 8 of the Local Plan proposes more housing and employment development in the Main Service Centres to contribute to a stronger local economy - additional housing that provides for a range of needs would, in general, support this approach.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>As discussed in Objective 13 Harvester Way (2.2km) and Horseshoe Yard (1.8km) are within the ideal 7km drive of the site. No employment sites are within the ideal 1km walk of the site. Good masterplanning will better enable residents to use sustainable transport through and from the site to access local employment. Therefore the site could improve physical access to local employment opportunities.</p> <p>Good masterplanning could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	<p>No infrastructure will be lost on site as a consequence of this proposal.</p> <p>Superfast broadband is provided to Crowland; given the size of the site an extension may be required to enable easy connection for all homes, which will enable residents to access a range of facilities on line.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 168 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. Based on the number of dwellings, the development would therefore be likely to generate 31 primary pupils and 30 secondary pupils. The nearest primary school is:</p> <ul style="list-style-type: none"> <li>• Crowland South View Community Primary School approx 860m from the site</li> </ul> <p>However, there are no secondary school or post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that primary school provision in the town is limited and that an extension to the existing school is required to accommodate the number of pupils development in the area is anticipated to generate. Furthermore, the closest secondary school and sixth form facilities (The Deepings) are at capacity with additional capacity being required.</p> <p>Development on this site will generate employment during the construction period; apprenticeships or employment of local long-term unemployed could help improve job prospects and prosperity for residents.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>No European or national environmental designations are near to the site.</p> <p>A tree belt runs through the site and other trees are found on the southern boundary. Development may lead to the loss of the trees; good design could ensure any impacts are minimalised by careful layout or replacements planted through development. Care should be taken to ensure that no development occurs within the Root Protection Areas of the trees as calculated using British Standard 5837:2012.</p> <p>Drainage channels runs along the northern and eastern boundary. All could provide space for the development (if not there at present) or enhancement (if already present) of multiple habitats which could support a range of BAP species. Ecosystem services could also be adversely affected; new development could potentially affect the water table and change the availability of ground water. The size of the site means that any direct damage and disturbance could be mitigated and betterment achieved through the provision of open space and/or structural landscaping, by using a mix of species, particularly of local provenance.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sustainable drainage would be expected to be provided to meet the needs of the development.</p>

<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site lies within The Fens National Character Area; the flat, visually open, arable fields within this site is a typical landscape characteristic. Built development of this size would have an adverse impact on the character of the area by extending the built form of Crowland north. However, the site would keep the settlement in line with the extent of the adjoining site to the east. The landscape and visual impact would be most prevalent in short views from the south and in long views from the north. Those parts of the site lying closest to the Crowland settlement boundary would have a more limited impact on the landscape.</p> <p>Good quality, structural landscaping would help reduce the landscape and visual impact, particularly from any sensitive receptors nearby. It would also help integrate this greenfield site with the countryside to the north. But new development would be visible until the landscaping became effective. However, the development could enhance the landscape in the east by screening existing employment uses, which would also protect the amenity of residents from the existing employment use to the west.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction would result in the generation of dust, the release of emissions from construction vehicles and the loss of trees. The extent to which air quality would be affected by development would depend upon mitigation to limit emissions and control dust during construction and the use of green infrastructure within the development. It is also likely that new housing development will increase traffic levels; with the current trend of car dependency likely to continue this could generate a negative impact on local air quality.</p> <p>Development could have some impact upon water quality during construction and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution can be achieved although the sewerage network may require an upgrade to accommodate foul water.</p> <p>The proposal would lead to the permanent loss of approx. 8.41 ha of Grade 2 agricultural land.</p>

<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the significant consumption of minerals in the form of building materials during construction. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>Considering the size of the site and new residents generated, it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 8.41 ha of greenfield land.</p> <p>The site is within the Sand and Gravel Minerals Safeguarding Zone so may have an adverse impact upon minerals resources.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zones 3a and 2 and is identified within the SFRA as 'no hazard' in terms of flood hazard and flood depth, Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>As discussed above, this site is within a 30/35 minute walk of most local facilities, services and transport links and, as travel to work by car (53.2%) is higher than the rest of the County (42.1%) and for England (36.9%), it is likely that the anticipated increase of 370 people would generate a significant number of new car journeys and hence carbon emissions. Good masterplanning and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that new homes built will be significantly more energy efficient than the older homes in Crowland. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy. An upgrade may be required to accommodate the level of development identified, for gas and electricity.</p> <p>The inclusion of landscaping and green infrastructure within the development should have a positive effect upon carbon absorption particularly if a mix of species is used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>Indices of Deprivation statistics (2015) indicate that the site does not lie within a deprived neighbourhood in terms of employment deprivation in the UK. But as Crowland is a Main Service Centre it is therefore likely that new development could have a positive impact on the local economy by bringing 370 people within the ideal 7km drive of Harvester Way (2.2km) and at Horseshoe Yard</p>

	<p>(1.8km) as well as to new employment development that may take place over the plan period. This may have a positive impact in reducing unemployment and raising average wage levels. An additional 370 residents may also help support the primacy of Crowland town centre, generating income for its shops and services. Good design will better enable residents to use sustainable transport from the site to access local employment sites and the town centre.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. Such a large site may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p>
--	---

<b>CRO038: Crowland Garden Centre, Postland Road, Crowland</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 3.92ha Potential open space: 0.55ha Development area: 3.37ha Potential no of dwellings: 78</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 524 dwellings proposed for Crowland over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Crowland and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Furthermore, housing sites partly within/adjacent to the defined settlement limits of Crowland would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The nearest open space (off Millfield Gardens) is within the ideal 1km walk of the site, being approx. 670m away. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are over 1km (600m for a community centre/village hall) away. Abbeyview Health Centre, Snowden Playing Fields and the Royal British Legion Centre are all outside the ideal distances.</p> <p>It is anticipated that the increase in population - approximately 172 people (2.2 occupants in each of the 78 dwellings) - associated with this site would put pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Crowland does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.55ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through</p>

	<p>the planning process it would have a positive impact on this objective. However should the site be developed with the adjoining Cro041, open space provision should be developed as a larger multifunctional space to better meet residents future recreational needs.</p> <p>Increased traffic generated by the development is likely to increase local air and noise pollution which could have a negative impact on physical and mental health.</p> <p>James Road runs along the south western boundary and Crowland Caravans lies to the north/north-west which could generate adverse impacts for resident's physical and mental health. Depth structural landscaping, such as trees and vegetation could help mitigate any identified impacts to create a satisfactory residential environment for future residents.</p>
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Crowland and Deeping St Nicholas) shows that 39.1% of households owned at least one car and 53.2% travelled to work by car/van, above the South Holland average of 45.8%.</p> <p>The site is outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the site is also outside the ideal 1km walking distance of the nearest convenience store. This could make it less likely that residents would use more sustainable travel options to meet their everyday shopping needs.</p> <p>The potential traffic generated by this site individually and cumulatively means that schemes to address traffic impact in and around Crowland should ensure that any increase in traffic does not restrict access to jobs and services, and promote safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable transport, particularly for local journeys. Good design will better enable sustainable transport options to be incorporated and available to residents throughout the site.</p> <p>Bus services currently operate to Spalding and Peterborough from Crowland. However, the nearest bus stop is outside the ideal 400m walking distance on Postland Road. This may discourage some from utilising public transport, particularly those who would reside at the north of the site. A public right of way is approx. 470m from the site meaning access to the countryside for recreation is good for residents.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>Indices of Deprivation statistics (2015) indicate that Crowland &amp; Deeping St Nicholas is not a deprived area. Even so, Policies 2 and 8 of the Local Plan proposes more housing and employment development in the Main Service Centres to contribute to a stronger local economy - but as the additional housing is partly within the Crowland settlement boundary this site would support this approach.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive</p>

	<p>effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>As discussed in Objective 13 Harvester Way (2.3m) and Horseshoe Yard (1.8m) are within the ideal 7km drive of the site. No sites are within the ideal 1km walk of the site. Good design will better enable residents to use sustainable transport from the site to access local employment. Therefore the site could improve physical access to local employment opportunities.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p> <p>Superfast broadband is provided to Crowland; an upgrade may be required to enable easy connection for all homes, which will enable residents to access a range of facilities on line.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 78 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. Based on the number of dwellings, the development would therefore be likely to generate 16 primary pupils and 15 secondary pupils. The nearest primary school is:</p> <ul style="list-style-type: none"> <li>• Crowland South View Community Primary School approx 740m from the site</li> </ul> <p>However, there are no secondary school or post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>Crowland currently requires additional capacity for primary, secondary and post-16 provision. Additional school places will therefore be needed to meet the needs of students living in the development; contributions may be sought to help address the negative impact generated by this development. The LEA will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period; apprenticeships or employment of local long-term unemployed could help improve job prospects and prosperity for residents.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>No European or national environmental designations are near to the site.</p> <p>Mature trees exist on site. Development may lead to their harm; good design could ensure any impacts are minimised by careful layout or replacements planted through development. Care should be taken to ensure that no development occurs within the Root Protection</p>

	<p>Areas of the trees as calculated using British Standard 5837:2012.</p> <p>Other vegetation and ponds are found on site and a drainage channel runs along the southern boundary. A drainage channel bisects the site and other drainage channels form the southern and eastern boundaries. All could provide space for the development (if not there at present) or enhancement (if already present) of multiple habitats which could support a range of BAP species. Ecosystem services could also be adversely affected; new development could potentially affect the water table and change the availability of ground water. The size of the site means that any direct damage and disturbance could be mitigated and betterment achieved through the provision of open space and/or structural landscaping, by using a mix of species, particularly of local provenance.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sustainable drainage would be expected to be provided to meet the needs of the development.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓/x</p> <p>The site is currently occupied by a garden centre - redevelopment is likely to have a positive impact on townscape particularly in terms of creating a vibrant streetscene and development form appropriate to the adjoining residential environment to the west. Such impact will, however, be dependent on implementation and design. Given the former use, the redevelopment is also likely to have a positive impact on residential amenity.</p> <p>There will be no impact on landscape.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction would result in the generation of dust, the release of emissions from construction vehicles and the loss of trees and other vegetation. The extent to which air quality would be affected by development would depend upon mitigation to limit emissions and control dust during construction and the use of green infrastructure within the development. It is also likely that new housing development will increase traffic levels; with the current trend of car dependency likely to continue this could generate a negative impact on local air quality.</p> <p>Development could have some impact upon water quality during construction and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p>

	<p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution can be achieved although the sewerage network may require an extension to accommodate foul water.</p> <p>This site does secure the redevelopment of 2.55ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials in the construction on this site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>This site does secure the redevelopment of 2.55ha of previously-developed land which could potentially see less greenfield land being developed elsewhere.</p> <p>The site is within the Sand and Gravel Minerals Safeguarding Zone so may have an adverse impact upon minerals resources.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as mostly 'danger for all' and 'danger for most' in terms of flood hazard. Flood depths vary across the site but most is 1.0-2.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>As discussed above, this site is within a 25/30 minute walk of most local facilities, services and transport links and as travel to work by car (53.2%) is higher than the rest of the County (42.1%) and for England (36.9%) it is likely that the anticipated increase in population of 172 people would generate additional new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that new homes built will be significantly more energy efficient than the older homes in Crowland. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy. An upgrade may be required to accommodate the</p>

	<p>level of development identified, for gas and electricity.</p> <p>The inclusion of landscaping and green infrastructure within the development should have a positive effect upon carbon absorption particularly if a mix of species is used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">x</p> <p>Indices of Deprivation statistics (2015) indicate that the site does not lie within a deprived neighbourhood in terms of income and employment deprivation. However, as Crowland is a Main Service Centre it is therefore likely that new development could have a positive impact on the local economy by bringing 172 people within the ideal 7km drive of Horseshoe Yard (1.8km) and Harvester Way (2.3km) as well as to new employment development that may take place over the plan period. This may have a positive impact in reducing unemployment and raising average wage levels. An additional 172 residents may also help support the primacy of Crowland town centre, generating income for its shops and services. Good design will better enable residents to use sustainable transport from the site to access local employment sites and the town centre.</p> <p>However this site is an operational garden centre and therefore provides employment for local residents. The development of this site would therefore see the loss of a local employer (3.92ha) which could have a negative impact on the potential for the local economy to provide jobs for local residents.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen). But it would also generate unemployment which may make the local economy vulnerable.</p> <p>The increased population (172 people) is likely to mean that traffic will be generated by this site. Schemes to minimise traffic impact in the area and enable sustainable transport will need to be considered in order to ensure that impact on the local road network do not worsen and are detrimental to the economy.</p>

<b>CRO041: Crowland Caravans, Postland Road, Crowland</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario: Total site area: 4.19ha Potential open space: 0.59ha Development area: 3.6ha Potential no of dwellings: 84</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 524 dwellings proposed for the Crowland area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of housing to be constructed on this site can help deliver the housing need identified for Crowland and South East Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites detached from defined settlement limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-</b>	x

<p><b>being</b></p>	<p>The nearest open space (Millfield Gardens) is approx. 720m away, within the ideal 1km walk of the site. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are over 1km (600m for a village/community hall), the ideal distance from housing development. Abbeyview Health Centre, Snowden Playing Fields and the Royal British Legion Centre are all outside the respective distances.</p> <p>It is anticipated that the increase in population - approximately 184 people (2.2 occupants in each of the 84 dwellings) - associated with this site would put pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Crowland does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.59ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective. However should the site be developed with the adjoining Cro041 open space provision should be developed as a larger multifunctional space to better meet residents future recreational needs.</p> <p>Increased traffic generated by the development is likely to increase local air and noise pollution which could have a negative impact on physical and mental health.</p> <p>A garden centre lies to the south which could generate adverse impacts for residents physical and mental health. Depth structural landscaping, such as trees and vegetation could help mitigate any identified impacts to create a satisfactory residential environment for future residents.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Crowland and Deeping St Nicholas) shows that 39.1% of households owned at least one car and 53.2% travelled to work by car/van, above the South Holland average of 45.8%.</p> <p>The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the site is outside the ideal distance to a big supermarket (7km) and the ideal 1km of a local convenience store – the car/van is likely to be the preferred mode of transport for this purpose. This could have a negative effect upon promoting sustainable travel options to Crowland's shops and local facilities.</p> <p>The potential traffic generated by this site individually and cumulatively means that schemes to address traffic impact in and around Crowland should ensure that any increase in traffic does not restrict access to jobs and services, and promote safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable transport, particularly for local journeys.</p>

	<p>Good design will better enable sustainable transport options to be incorporated and available to residents throughout the site.</p> <p>Bus services currently operate to Spalding and Peterborough through Crowland. However, the nearest bus stops are approx 580m from the site (well outside the preferred 400m walking distance), meaning that access to public transport access would be limited for residents. A public right of way is within the ideal 1km of the site meaning access to the countryside for recreation is good for residents.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">x</p> <p>Indices of Deprivation statistics (2015) indicate that Crowland &amp; Deeping St Nicholas is not a deprived area. Policy 2 of the Local Plan proposes more housing and employment development in the Main Service Centres to contribute to a stronger local economy, but as the additional housing is detached from the Crowland settlement boundary development of this site would be contrary to this approach.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>As discussed in Objective 13, Harvester Way (3.0km) and Horseshoe Yard (2.0m) are both within the ideal 7km driving distance of the site. Neither employment site is within the ideal 1km walk of the site. Although good design will better enable residents to use sustainable transport from the site it is unlikely that significant improvements to physical access to local employment opportunities could be achieved.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p> <p>Superfast broadband is provided to Crowland; as the site is within a detached location an upgrade may be required to enable easy connection for all homes, which will enable residents to access a range of facilities on line.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 84 dwellings. On average every 5 homes of new housing generates 1 primary aged pupil and every 7 new houses generates 1 secondary aged pupil. Based on the number of dwellings, the development would therefore be likely to generate 17 primary pupils and 16 secondary pupils. The nearest primary school is:</p> <ul style="list-style-type: none"> <li>• Crowland South View Community Primary School approx 1.0km from the site</li> </ul>

	<p>However, there are no secondary school or post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>Crowland currently requires additional capacity for primary, secondary and post-16 provision. Additional school places will therefore be needed to meet the needs of students living in the development; contributions may be sought to help address the negative impact generated by this development. The LEA will continue to review school place provision annually. This will inform any scheme should it come forward for development.</p> <p>Development on this site will generate employment during the construction period; apprenticeships or employment of local long-term unemployed could help improve job prospects and prosperity for residents.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>No European or national environmental designations are near to the site.</p> <p>Mature and establishing tree belt exists along the northern and north western boundary. Development may lead to their harm; good design could ensure any impacts are minimalised by careful layout or replacements planted through development. Care should be taken to ensure that no development occurs within the Root Protection Areas of the trees as calculated using British Standard 5837:2012.</p> <p>Other vegetation and drainage channels run along the north, west and eastern boundaries. A drainage channel bisects the site and other drainage channels form the southern and eastern boundaries. All could provide space for the development (if not there at present) or enhancement (if already present) of multiple habitats which could support a range of BAP species. Ecosystem services could also be adversely affected; new development could potentially affect the water table and change the availability of ground water. The size of the site means that any direct damage and disturbance could be mitigated and betterment achieved through the provision of open space and/or structural landscaping, by using a mix of species, particularly of local provenance.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sustainable drainage would be expected to be provided to meet the needs of the development.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and</b>	<p style="text-align: center;">✓/x</p>

<b>Townscape</b>	<p>The site is occupied by a caravan sales business which appears to be contained within the southern part of the site. Redevelopment is likely to have a positive impact on townscape particularly in terms of creating a vibrant streetscene and development form appropriate to the adjoining residential environment to the west. Such impact will, however, be dependent on implementation and design. Given the former use, the redevelopment is also likely to have a positive impact on residential amenity</p> <p>However the northern part of the site appears to be greenfield; residential development would entail a fundamental change in character extending the built form of Crowland north. However should the tree belts remain they would minimise adverse landscape and visual impacts from the north/north-west. However the site would be prevalent in views particularly from the east resulting in an incongruous residential development.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓/x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction would result in the generation of dust, the release of emissions from construction vehicles and the loss of trees and other vegetation. The extent to which air quality would be affected by development would depend upon mitigation to limit emissions and control dust during construction and the use of green infrastructure within the development. It is also likely that new housing development will increase traffic levels; with the current trend of car dependency likely to continue this could generate a negative impact on local air quality.</p> <p>Development could have some impact upon water quality during construction and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution can be achieved although the sewerage network may require an extension to accommodate foul water.</p> <p>However this site does secure the redevelopment of 1.93ha of previously-developed land which could potentially see less greenfield land being developed elsewhere. However. the site will see the loss of 2.26ha of greenfield land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials in the construction on this site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>However this site does secure the redevelopment of 1.93ha of previously-developed land which could potentially see less greenfield land being developed elsewhere. However. the site will see the loss of 2.26ha of greenfield land.</p> <p>The site is within the Sand and Gravel Minerals Safeguarding Zone so may have an adverse impact upon minerals resources.</p>

<b>11. Flood Risk</b>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as mostly 'danger for most' followed by 'danger for all' in terms of flood hazard, with very small parts being either 'danger for some' or 'no hazard'. Flood depths vary across the site but the vast majority is 1.0-2.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>As discussed above, this site is within a 35/40 minute walk of most local facilities, services and transport links and, as travel to work by car (53.2%) is higher than the rest of the County (42.1%) and for England (36.9%), it is likely that the anticipated increase in population of 184 people and the detached location of the site from Crowland, would generate additional new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that new homes built will be significantly more energy efficient than the older homes in Crowland. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy. An upgrade may be required to accommodate the level of development identified, for gas and electricity.</p> <p>The inclusion of landscaping and green infrastructure within the development should have a positive effect upon carbon absorption particularly if a mix of species is used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">x</p> <p>Indices of Deprivation statistics (2015) indicate that the site does not lie within a deprived neighbourhood in terms of income and employment deprivation. But as Crowland is a Main Service Centre it is therefore likely that new development could have a positive impact on the local economy by bringing 184 people within the ideal 7km drive of Horseshoe Yard (2km) and Harvester Way (3km) as well as to new employment development that may take place over the plan period. This may have a positive impact in reducing unemployment and raising average wage levels. An additional 184 residents may also help support the primacy of Crowland town centre, generating income for its shops and services. Good design will better enable residents to use sustainable transport from the site to access local employment sites and the town centre.</p> <p>However this site is an operational caravan sales centre and therefore provides employment for local residents. The development of this site would therefore see the loss of a local employer (4.1ha) which could have a negative impact on the potential for the local economy to provide jobs for local residents.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen). But it would</p>

	<p>also generate unemployment which may make the local economy vulnerable.</p> <p>The increased population (172 people) is likely to mean that traffic will be generated by this site. Schemes to minimise traffic impact in the area and enable sustainable transport will need to be considered in order to ensure that impact on the local road network do not worsen and are detrimental to the economy.</p>
--	--

<b>CRO045: Land west of Clout Drove, Crowland</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 5.12ha Potential open space: 0.72ha Development area: 4.4ha Potential no of dwellings: 102</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 524 dwellings proposed for Crowland over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site can help deliver the housing need identified for Crowland and South East Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to defined settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">x</p> <p>The nearest open space (Foremans Way) is within the ideal 1km (510m) walking of the site. However, other facilities and services that would help to maintain health and promote healthy lifestyles are over 1km (600m for a village/community hall) walking distance away, the ideal distance from housing development. The Abbeyview Health Centre, Stricklands Drive Playing Fields and the Royal British Legion Centre are all outside the ideal distances.</p> <p>It is anticipated that the increase in population - approximately 224 people (2.2 occupants in each of the 102 dwellings) - associated with this site would put pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Crowland does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.72ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Increased traffic generated by the development, individually and cumulatively with other development is likely to increase local air and noise pollution which could have a negative impact on physical and mental health.</p>

	There are no bad neighbours nearby.
<b>3. Transport</b>	<p style="text-align: right;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Crowland and Deeping St Nicholas) shows that 39.1% of households owned at least one car and 53.2% travelled to work by car/van, above the South Holland average of 45.8%.</p> <p>The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. But the site is outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. However the site is within the ideal 1km of a local convenience store (589m) which could have a positive effect upon promoting sustainable travel to Crowland’s shops and local facilities. Designing safe routes for pedestrians and cyclists from the site to North Bank/Clout Drove would help promote sustainable access for residents.</p> <p>The potential traffic generated by this site individually and cumulatively means that schemes to address traffic impact in and around Crowland should ensure that any increase in traffic does not restrict access to jobs and services, and promote safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. Good design will better enable sustainable transport options to be incorporated and available to residents throughout the site.</p> <p>Bus services currently operate to Spalding and Peterborough; the nearest bus stops are within 670m of the site on Postland Road, meaning access to public transport is limited for residents. A public right of way runs north-south along North Bank, about 20m from the site meaning access to the countryside for recreation is good.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: right;">✓/x</p> <p>Indices of Deprivation statistics (2015) indicate that Crowland &amp; Deeping St Nicholas is not within a deprived area. Even so, Policies 2 and 8 of the Local Plan proposes more housing and employment development in the Main Service Centres to contribute to a stronger local economy - additional housing adjacent to the Crowland settlement boundary would support this approach.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>As discussed in Objective 13 Harvester Way (2.6km) and Horseshoe Yard (1.4km) are within the ideal 7km drive of the site. No sites are within the ideal 1km walk of the site. Good design will better enable residents to use sustainable transport from the site to access local employment. Therefore the site could improve physical access to local employment opportunities.</p>

	<p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p> <p>Superfast broadband is provided to Crowland; an upgrade may be required to enable easy connection for all homes, which will enable residents to access a range of facilities on line.</p>
<b>5. Education</b>	<p style="text-align: center;">x</p> <p>The development would be likely to accommodate 102 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. Based on the number of dwellings, the development would therefore be likely to generate 20 primary pupils and 19 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Crowland South View Community Primary School: within 620m of the site</li> </ul> <p>However, there are no secondary school or post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that primary school provision in the town is limited and that an extension to the existing school is required to accommodate the number of pupils development in the area is anticipated to generate. Furthermore, the closest secondary school and sixth form facilities (The Deepings) are at capacity with additional capacity being required.</p> <p>Development on this site will generate employment during the construction period; apprenticeships or employment of local long-term unemployed could help improve job prospects and prosperity for residents.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>No European, national or local environmental designations are near to the site.</p> <p>Drainage channels run along all or parts of all boundaries. These could provide space for the development (if not there at present) or enhancement (if already present) of multiple habitats which could support a range of BAP species. Ecosystem services could also be adversely affected; new development could potentially affect the water table and change the availability of ground water. The size of the site means that any direct damage and disturbance could be mitigated and betterment achieved through the provision of open space and/or structural landscaping, by using a mix of species, particularly of local provenance.</p> <p>There is a PROW nearby; it is likely that residential development on this site will have an adverse impact upon biodiversity present due to increased footfall, and potentially flytipping. There are opportunities to mitigate, to a certain extent, the potential negative impacts on biodiversity, and indeed make some local improvements, through good design (i.e. structural planting, the use of a mix of species and provenance and good quality open space).</p>

	<p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11 sustainable drainage would be expected to be provided to meet the needs of the development.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site lies within The Fens National Character Area; the flat, visually open, arable field within this site is a typical landscape characteristic. The site would extend the built development north; built development would entail a fundamental change in character by delivering a significant number of new homes in the countryside. The site would be highly visible from the countryside to the north, north west and north east and in short views from properties to the east.</p> <p>Structural landscaping could help integrate this edge of urban area site with the countryside to the north. But new development would be visible until such time as the structural landscaping became effective.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of design and implementation.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction would result in the generation of dust and the release of emissions from construction vehicles. The extent to which air quality would be affected by development would depend upon mitigation to limit emissions and control dust during construction and the use of green infrastructure within the development. It is also likely that new housing development will increase traffic levels; with the current trend of car dependency likely to continue this could generate a negative impact on local air quality.</p> <p>Development could have some impact upon water quality during construction and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p>

	<p>Demand from the site may place a burden on the existing sewerage system - Anglian Water considers that the foul sewerage and water supply networks may require upgrading to serve the proposed growth or diversion of assets may be required. There is considered to be capacity available at Crowland's Water Recycling Centre. However, across South East Lincolnshire Anglian Water have commented that, in terms of the surface water network, there are major constraints to the provision of infrastructure and/or treatment. A sewer pipe crosses the site and must remain accessible for future maintenance. The design of the site should take this into consideration.</p> <p>The proposal would lead to the permanent loss of approx. 5.12 ha of Grade 2 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the significant consumption of minerals in the form of building materials in the construction on this site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>Considering the size of the site and new residents generated, it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 5.12 ha of greenfield land.</p> <p>The site will safeguard minerals resources as it lies outside the minerals safeguarding zones.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zones 3a, 1 and 2 and is identified within the SFRA as 'no hazard' in terms of flood hazard and flood depth, Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>As discussed above, this site is within a 25/30 minute walk of most local facilities, services and transport links and as travel to work by car (53.2%) is higher than the rest of the County (42.1%) and for England (36.9%) it is therefore likely that the anticipated increase of 224 people would generate an additional number of new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Crowland. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy. An upgrade may be required to accommodate the level of development identified, for gas and electricity.</p>

	The inclusion of landscaping and green infrastructure within the development should have a positive effect upon carbon absorption particularly if a mix of species are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>Indices of Deprivation statistics (2015) indicate that the site does not lie within a deprived neighbourhood in terms of income and employment deprivation. But as Crowland is a Main Service Centre it is therefore likely that new development could have a positive impact on the local economy by bringing 224 people within the ideal 7km drive of Harvester Way (2.6km) and Horseshoe Yard (1.4km) as well as to new employment development that may take place over the plan period. This may have a positive impact in reducing unemployment and raising average wage levels. An additional 224 residents may also help support the primacy of Crowland town centre, generating income for its shops and services. Good design will better enable residents to use sustainable transport from the site to access local employment sites and the town centre.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (224 people) is likely to mean that a significant amount of traffic will be generated by this site. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network do not worsen and are detrimental to the economy.</p>

## Main Service Centres: Donington

DON010: Land to the north of 12 Market Place, Donington	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.39ha Potential open space: 0.05ha Development area: 0.34ha Potential no of dwellings: 2
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute to the level of housing identified for the Donington area over the plan period and will have a positive impact on this objective.
<b>2. Health and Well-being</b>	✓/x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Open space and the village playing field is located opposite Thomas Cowley High School, around 680m away. The Ruby Hunt [pop-in] Centre is approx. 310m from the site, although the nearest health centre is Gosberton Medical Centre in Gosberton at about 6km away.</p> <p>It is anticipated that the increase in population – approximately 4 people (2.2 occupants in each of the 2 dwellings) - associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Local air and noise pollution is likely to slightly increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	✓/x
	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Donington, Quadring and Gosberton) showed that 89.1% of households owned at least one car and 47.6% travelled to work by car/van, above the Lincolnshire averages of 82% and 42.1%.</p> <p>The site is well outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. The centre of the site is within the ideal 1km distance of the local shop from a housing site, being around 190m from the Co-operative store in Market Place. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p>

	<p>The potential traffic generated by this site on its own and with other housing nearby means that schemes to address traffic impact in and around Donington should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services currently operate 7 times daily (weekdays) between Spalding and Boston; the nearest bus stops around 240m from the site on Station Street near Market Place, within the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Donington, Quadring and Gosberton: Compared with the Lincolnshire average, its long term unemployment rate was above average (34.4% compared to 25.6%). However, those without access to a car is below average (10.9% compared to 18%) while crime rate per 1000 is 25.7 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Don010 is outside the ideal walking distance of the majority of services and facilities and public transport links which may have an impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Millfield Road Industrial Estate (660m) are within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 2 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Donington Cowley Endowed Primary School is around 1.1km from the site</li> <li>• Thomas Cowley High School is approx. 490m away</li> </ul>

	<p>However, there are no post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that Donington currently has a lack of capacity at primary and secondary level. Additional classrooms would be required at the primary school to accommodate the number of pupils new development is anticipated to generate. However, the secondary school is located on a constrained site and so additional secondary level provision would require careful consideration.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on mature trees on the northern, eastern and western boundaries. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>The site does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site could have adverse impacts on the Donington Conservation Area located adjacent to the site. Any such impacts could be prevented by careful design.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is located within the development limits of Donington – built development of this site is not likely to have an impact on the character of the landscape as it has development to the west, south and east meaning that it does not have a countryside character.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Donington area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-</p>

	<p>off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>South Holland District Council's contaminated land register indicates that there is some filled land on the site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.39ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓✓</p> <p>This site is within Environment Agency Flood Zone 1 (no hazard, no depth). This means that the site is within a sequentially preferable location in terms of flood risk so generates a positive impact.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used, and through green infrastructure; natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>The majority of services and facilities are within the ideal walking distances from the site meaning that there may be less need to travel by car. Even so, as identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. It is likely that the anticipated increase in 4 people would generate some new car journeys and hence carbon emissions. Legible and safe access</p>

	<p>and egress for pedestrians, cyclists as well as vehicles, would have a positive effect upon promoting sustainable travel options.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Donington. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Donington are currently at capacity and so reinforcement works would be required in order for new capacity to be released.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Donington – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this it is likely that new development could have a positive impact on the local economy by bringing 4 people within both the ideal 7km drive and 1km walk of employment opportunities in Donington (Millfield Road Industrial Estate). There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (4 people) will generate some additional traffic. Safe access and egress will be required to ensure that impact on the local road network does not worsen and are detrimental to the economy.</p>

DON012: Land to the north of Park Lane, Donington	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 1ha Potential open space: 0.14ha Development area: 0.86ha  Potential no of dwellings: 20</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 472 dwellings proposed for the Donington area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Donington and SE Lincolnshire it will have a positive impact on this objective.</p>

	<p>Housing sites adjacent to the development limits of Donington would, in general, be more important to the delivery of the settlement hierarchy.</p>
<p><b>2. Health and Well-being</b></p>	<p style="text-align: center;">x</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Open space and the village playing field is located opposite Thomas Cowley High School around 1.02km away. The Ruby Hunt [pop-in] Centre is approx. 655m from the site and the nearest health centre is Gosberton Medical Centre in Gosberton at about 6.3km away.</p> <p>It is anticipated that the increase in population – approximately 44 people (2.2 occupants in each of the 20 dwellings) - associated with this site would place pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Donington does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.14ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The site is in close proximity to the A52 which may have an adverse impact on the amenities that would be enjoyed by new dwellings. Structural landscaping such as trees of mixed provenance may be necessary to help mitigate any noise and air pollution. Design and layout should be considered carefully.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Donington, Quadring and Gosberton) showed that 89.1% of households owned at least one car and 47.6% travelled to work by car/van, above the Lincolnshire averages of 82% and 42.1%.</p> <p>The site is well outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. The centre of the site is within the ideal 1km distance of the local shop from a housing site, being around 540m from the Co-operative store in Market Place. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own and with other housing nearby means that schemes to address traffic impact in and</p>

	<p>around Donington should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services currently operate 7 times daily (weekdays) between Spalding and Boston; the nearest bus stops around 610m from the site on Station Street near Market Place, outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Donington, Quadring and Gosberton: Compared with the Lincolnshire average, its long term unemployment rate was above average (34.4% compared to 25.6%). However, those without access to a car is below average (10.9% compared to 18%) while crime rate per 1000 is 25.7 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Don012 is outside the ideal walking distance of some services and facilities and public transport links which may have an impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at the Millfield Road Industrial Estate (990m) is within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 20 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 4 primary pupils and 4 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Donington Cowley Endowed Primary School is around 1.5km from the site</li> <li>• Thomas Cowley High School is approx. 870m away</li> </ul>

	<p>However, there are no post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that Donington currently has a lack of capacity at primary and secondary level. Additional classrooms would be required at the primary school to accommodate the number of pupils new development is anticipated to generate. However, the secondary school is located on a constrained site and so additional secondary level provision would require careful consideration.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">0</p> <p>The site is relatively free of environmental constraints and it does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓/x</p> <p>The site is located adjacent to the development limits of Donington – built development of this site will have some impact on the character of the landscape as it will extend the built up area to the A52. However, the A52 acts as a natural end to the built up area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Donington area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>South Holland District Council's contaminated land register indicates that there is some filled land on the site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 1ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and flood depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Donington for the plan period.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should</p>

	<p>take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some facilities and services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. It is likely that the anticipated increase in 44 people would generate new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Donington. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Donington are currently at capacity and so reinforcement works would be required in order for new capacity to be released.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Donington – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this it is likely that new development could have a positive impact on the local economy by bringing 44 people within both the ideal 7km drive and 1km walk of employment opportunities in Donington (Millfield Road Industrial Estate). There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p>

	<p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (44 people) will generate some additional traffic. Safe access and egress will be required to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
--	---

**DON016: Land to the south of Town Dam Lane, Donington**

<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 1.35ha Potential open space: 0.19ha Development area: 1.16ha  Potential no of dwellings: 27</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 472 dwellings proposed for the Donington area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Donington and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites detached from the development limits of Donington would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓/x</p> <p>Open space and the village playing field is located opposite Thomas Cowley High School, around 890m away. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The Donington Community Centre is approx. 750m from the site and the nearest health centre is Gosberton Medical Centre in Gosberton at about 5.1km away.</p> <p>It is anticipated that the increase in population – approximately 59 people (2.2 occupants in each of the 27 dwellings) - associated with this site would place some pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Donington does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.19ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p>

	Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.
<b>3. Transport</b>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Donington, Quadring and Gosberton) showed that 89.1% of households owned at least one car and 47.6% travelled to work by car/van, above the Lincolnshire averages of 82% and 42.1%.</p> <p>The site is well outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. The centre of the site is just within the ideal 1km distance of the local shop from a housing site, being around 990m from the Costcutter store on High Street. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own and with other housing nearby means that schemes to address traffic impact in and around Donington should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services currently operate 7 times daily (weekdays) between Spalding and Boston; the nearest bus stops around 850m from the site on Quadring Road adjacent the pumping station, outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Donington, Quadring and Gosberton: Compared with the Lincolnshire average, its long term unemployment rate was above average (34.4% compared to 25.6%). However, those without access to a car is below average (10.9% compared to 18%) while crime rate per 1000 is 25.7 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Don019 is outside the ideal walking distance of some services and facilities and public transport links which may have an impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Millfield Road Industrial Estate (1.4km) are within the ideal 7km drive of the site. However, they are outside the ideal 1km walk which might discourage residents from walking to work. There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p>

	<p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 27 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 5 primary pupils and 5 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Donington Cowley Endowed Primary School is around 470m from the site</li> <li>• Thomas Cowley High School is approx. 820m away</li> </ul> <p>However, there are no post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that Donington currently has a lack of capacity at primary and secondary level. Additional classrooms would be required at the primary school to accommodate the number of pupils new development is anticipated to generate. However, the secondary school is located on a constrained site and so additional secondary level provision would require careful consideration.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">0</p> <p>The site is relatively free from environment constraints and it does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may</p>

	then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Donington and does not relate as well as other sites to the existing built-up area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Donington area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>South Holland District Council's contaminated land register indicates that the site is near one that has been used for clay brick and tile manufacture meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 1.35ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.35ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	✓

	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and flood depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Donington for the plan period, and protection of the quality and character of landscape and townscape.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some facilities and services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. It is likely that the anticipated increase in 59 people would generate new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Donington. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p>

	<p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Donington are currently at capacity and so reinforcement works would be required in order for new capacity to be released.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Donington – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this it is likely that new development could have a positive impact on the local economy by bringing 59 people within the ideal 7km drive of employment opportunities in Donington (Millfield Road Industrial Estate). However, the site is outside the 1km ideal walking distance of employment opportunities which may inhibit the use of more sustainable transport modes such as walking. There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (59 people) will generate some additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>DON017: Land to the north of Town Dam Lane, Donington</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:            Total site area: 6.19ha Potential open space: 0.87ha Development area: 5.32ha            Potential no of dwellings: 124</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 472 dwellings proposed for the Donington area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Donington and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to the development limits of Donington would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓/x</p> <p>Open space and the village playing field is located opposite Thomas Cowley High School, around 590m away. However, other facilities</p>

	<p>and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The Ruby Hunt [pop-in] Centre is approx. 1.1km from the site and the nearest health centre is Gosberton Medical Centre in Gosberton at about 5.1km away.</p> <p>It is anticipated that the increase in population – approximately 273 people (2.2 occupants in each of the 124 dwellings) - associated with this site would place considerable pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Donington does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.87ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The north-eastern facing boundary of the site fronts onto the relatively busy A152 and so structural landscaping such as trees of mixed provenance, may be necessary along this boundary to help mitigate any noise and air pollution. Design and layout should be carefully considered.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Donington, Quadring and Gosberton) showed that 89.1% of households owned at least one car and 47.6% travelled to work by car/van, above the Lincolnshire averages of 82% and 42.1%.</p> <p>The site is well outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. The centre of the site is within the ideal 1km distance of the local shop from a housing site, being around 830m from the Costcutter store on High Street. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own and with other housing nearby means that schemes to address traffic impact in and around Donington should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services currently operate 7 times daily (weekdays) between Spalding and Boston; the nearest bus stops around 360m from the site on Quadring Road opposite the pumping station, within the ideal 400m walking distance.</p>

<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Donington, Quadring and Gosberton: Compared with the Lincolnshire average, its long term unemployment rate was above average (34.4% compared to 25.6%). However, those without access to a car is below average (10.9% compared to 18%) while crime rate per 1000 is 25.7 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Don017 is outside the ideal walking distance of some services and facilities and public transport links which may have an impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Millfield Road Industrial Estate (1.5km) are well within the ideal 7km drive of the site. However, they are outside the ideal 1km walk which might discourage residents from walking to work. There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓/x</p> <p>The development would be likely to accommodate 124 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 25 primary pupils and 24 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Donington Cowley Endowed Primary School is around 900m from the site</li> <li>• Thomas Cowley High School is approx. 620m away</li> </ul> <p>However, there are no post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that Donington currently has a lack of capacity at primary and secondary level. Additional classrooms would be required at the primary school to accommodate the number of pupils new development is anticipated to generate. However, the secondary school is located on a constrained site and so additional secondary level provision would require careful</p>

	<p>consideration.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	0
	<p>The site appears to be free of environmental constraints and it does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	0
	<p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	✓
	<p>The site is located adjacent to the development limits of Donington – built development of this site would alter the character and appearance of the landscape as it would extend development to the highway. However, it would act as a natural extension to the built up area of Donington as it is bounded by residential development to the west, Quadring Road to the north and Town Dam Lane to the south. This site could be brought forward in combination with either Don029 and/or Don018 and Don031 as a larger natural extension.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	x
	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Donington area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>South Holland District Council's contaminated land register indicates that the site is near one that has been used for clay brick and tile manufacture meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green</p>

	<p>infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 6.19ha of predominantly grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 6.19ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is a mix of Flood Zones 1, 3a and 2 and is identified within the SFRA as 'no hazard' in terms of flood hazard and flood depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (273 people) will generate some additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is</p>

	detrimental to the economy.
--	-----------------------------

<b>DON029: Land adjacent to 69 Quadring Road, Donington</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.57ha Potential open space: 0.08ha Development area: 0.49ha Potential no of dwellings: 11
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute to the level of housing identified for the Donington area over the plan period and will have a positive impact on this objective.  Housing sites detached from the development limits of Donington would, in general, be contrary to the principles of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓/x
	Open space and the village playing field is located opposite Thomas Cowley High School, around 900m away. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The Ruby Hunt [pop-in] Centre is approx. 1.5km from the site and the nearest health centre is Gosberton Medical Centre in Gosberton at about 4.8km away.  It is anticipated that the increase in population – approximately 24 people (2.2 occupants in each of the 11 dwellings) - associated with this site would place some pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.  The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.  Overall, Donington does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the potential number of dwellings, open space may be required. However, given the size of the site, it may be more usefully sought as a financial contribution to improve the quality and multifunctionality of existing open space in Donington to accommodate future residents.  Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The north-eastern facing boundary of the site fronts onto the relatively busy A152 and so structural landscaping such as trees of mixed provenance, may be necessary along this boundary to help mitigate any noise and air pollution. Design and layout should be considered carefully.
<b>3. Transport</b>	x
	It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Donington, Quadring and

	<p>Gosberton) showed that 89.1% of households owned at least one car and 47.6% travelled to work by car/van, above the Lincolnshire averages of 82% and 42.1%.</p> <p>The site is well outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the centre of the site is outside the ideal 1km distance of the local shop from a housing site, being around 1.1km from the Costcutter store on High Street.</p> <p>The potential traffic generated by this site on its own and with other housing nearby means that schemes to address traffic impact in and around Donington should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services currently operate 7 times daily (weekdays) between Spalding and Boston; the nearest bus stops around 600m from the site on Quadring Road opposite Washdike Lane, outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Donington, Quadring and Gosberton: Compared with the Lincolnshire average, its long term unemployment rate was above average (34.4% compared to 25.6%). However, those without access to a car is below average (10.9% compared to 18%) while crime rate per 1000 is 25.7 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Don029 is outside the ideal walking distance of some services and facilities and public transport links which may have an impact on social inclusion. However, they are outside the ideal 1km which might discourage residents from walking to work. There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Millfield Road Industrial Estate (1.7km) are within the ideal 7km drive of the site.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	No infrastructure will be lost on site as a consequence of this proposal.
<b>5. Education</b>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 11 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 2 primary pupils and 2 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Donington Cowley Endowed Primary School is around 730m from the site</li> <li>• Thomas Cowley High School is approx. 970m away</li> </ul> <p>However, there are no post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that Donington currently has a lack of capacity at primary and secondary level. Additional classrooms would be required at the primary school to accommodate the number of pupils new development is anticipated to generate. However, the secondary school is located on a constrained site and so additional secondary level provision would require careful consideration.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">0</p> <p>The site appears to be free of environmental constraints and it does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓/x</p> <p>The site is detached from the development limits of Donington – built development of this site would alter the character and appearance of the landscape as it will extend development to the highway. However, it could act as a natural extension to the built up area of</p>

	<p>Donington as it is bounded by Quadring Road to the north and Town Damn Lane to the south. The site could be brought forward in combination with either Don017 and/or Don018 and Don031.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<p><b>9. Air, Soil and Water Resources</b></p>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Donington area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 0.57ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.57ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and flood depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site.</p>

	<p>Furthermore, given the housing need identified, the allocation of the other sites alone would be insufficient to meet this need. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Donington for the plan period.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some facilities and services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. It is likely that the anticipated increase in 24 people would generate a considerable number of new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Donington. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Donington are currently at capacity and so reinforcement works would be required in order for new capacity to be released.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species</p>

	and provenance are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓/x
	The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Donington – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this it is likely that new development could have a positive impact on the local economy by bringing 24 people within the ideal 7km drive of employment opportunities in Donington (Millfield Road Industrial Estate). However, the site is outside the 1km ideal walking distance which may inhibit the use of more sustainable travel modes, such as walking, to access employment. There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.
	Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).
	The increased population (24 people) will generate some additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.

<b>DON031: Land to the north-east of Quadring Road, Donington</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.33ha Potential open space: 0.05ha Development area: 0.28ha Potential no of dwellings: 7
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute to the level of housing identified for the Donington area over the plan period and will have a positive impact on this objective.  Housing sites detached from the development limits of Donington would, in general, be contrary to the principles of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓/x
	Open space and the village playing field is located opposite Thomas Cowley High School, around 550m away. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The Ruby Hunt [pop-in] Centre is approx. 1.1km from the site and the nearest health centre is Gosberton Medical Centre in Gosberton at about 5km away.  It is anticipated that the increase in population – approximately 15 people (2.2 occupants in each of the 7 dwellings) - associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.

	<p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The south western facing boundary of the site fronts onto the relatively busy A152 and so structural landscaping such as trees of mixed provenance, may be necessary along the south westerly facing boundary to help mitigate any noise and air pollution. Design and layout should be considered carefully.</p>
<b>3. Transport</b>	<p style="text-align: right;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Donington, Quadring and Gosberton) showed that 89.1% of households owned at least one car and 47.6% travelled to work by car/van, above the Lincolnshire averages of 82% and 42.1%.</p> <p>The site is well outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. The centre of the site is within the ideal 1km distance of the local shop from a housing site, being around 830m from the Costcutter store on High Street. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own and with other housing nearby means that schemes to address traffic impact in and around Donington should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services currently operate 7 times daily (weekdays) between Spalding and Boston; the nearest bus stops around 370m from the site on Quadring Road adjacent to the pumping station, within the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: right;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Donington, Quadring and Gosberton: Compared with the Lincolnshire average, its long term unemployment rate was above average (34.4% compared to 25.6%). However, those without access to a car is below average (10.9% compared to 18%) while crime rate per 1000 is 25.7 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p>

	<p>Don031 is outside the ideal walking distance of some services and facilities and public transport links which may have an impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Millfield Road Industrial Estate (1.4km) are well within the ideal 7km drive of the site. However, they are outside the ideal 1km which might discourage residents from walking to work. There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 7 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Donington Cowley Endowed Primary School is around 920m from the site</li> <li>• Thomas Cowley High School is approx. 630m away</li> </ul> <p>However, there are no post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that Donington currently has a lack of capacity at primary and secondary level. Additional classrooms would be required at the primary school to accommodate the number of pupils new development is anticipated to generate. However, the secondary school is located on a constrained site and so additional secondary level provision would require careful consideration.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site is likely to have an adverse effect on mature trees within the site. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>The site does not include, and is not in close proximity to, any statutory designated sites.</p>

	<p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓/x</p> <p>The site is detached from the development limits of Donington – built development of this site would alter the character and appearance of the landscape as it will extend development onto an area surrounded by highway. However, it could act as a natural extension to the built up area of Donington if brought forward in conjunction with Don018 and Don017.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Donington area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly</p>

	<p>relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.33ha of predominantly greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is predominantly within Environment Agency Flood Zone 3a and is identified within the SFRA as 'no hazard' in terms of flood hazard and flood depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Donington for the plan period.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (15 people) will generate some additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>DON032: Land to the north-east of Park Lane, Donington</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 2.12ha Potential open space: 0.30ha Development area: 1.82ha Potential no of dwellings: 64
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 472 dwellings proposed for the Donington area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Donington and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to the development limits of Donington would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓/x
	<p>Open space and the village playing field is located opposite Thomas Cowley High School, just within the ideal walking distance at around 990m away. However, other facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The Ruby Hunt [pop-in] Centre is approx. 655m from the site and the nearest health centre is Gosberton Medical Centre in Gosberton at about 6.3km away.</p> <p>It is anticipated that the increase in population – approximately 141 people (2.2 occupants in each of the 64 dwellings) - associated with this site would place pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Donington does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.30ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The site is in close proximity to the A52 which may have an adverse impact on the amenities that would be enjoyed by new dwellings. Structural landscaping such as trees of mixed provenance may be necessary to help mitigate any noise and air pollution. Design and layout should be considered carefully.</p>
<b>3. Transport</b>	x

	<p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Donington, Quadring and Gosberton) showed that 89.1% of households owned at least one car and 47.6% travelled to work by car/van, above the Lincolnshire averages of 82% and 42.1%.</p> <p>The site is well outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. The centre of the site is within the ideal 1km distance of the local shop from a housing site, being around 540m from the Co-operative store in Market Place. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own and with other housing nearby means that schemes to address traffic impact in and around Donington should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services currently operate 7 times daily (weekdays) between Spalding and Boston; the nearest bus stops around 600m from the site on Station Street near Market Place, outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Donington, Quadring and Gosberton: Compared with the Lincolnshire average, its long term unemployment rate was above average (34.4% compared to 25.6%). However, those without access to a car is below average (10.9% compared to 18%) while crime rate per 1000 is 25.7 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Don032 is outside the ideal walking distance of some services and facilities and public transport links which may have an impact on social inclusion.</p> <p>As discussed in Objective 13 the nearest employment opportunities at Millfield Road Industrial Estate (930m) are within the ideal 7km drive and 1km walk of the site. This would have a positive impact, providing good access for residents to local employment. There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	No infrastructure will be lost on site as a consequence of this proposal.
<b>5. Education</b>	✓/x
	<p>The development would be likely to accommodate 64 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 13 primary pupils and 12 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Donington Cowley Endowed Primary School is around 1.5km from the site</li> <li>• Thomas Cowley High School is approx. 820m away</li> </ul> <p>However, there are no post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that Donington currently has a lack of capacity at primary and secondary level. Additional classrooms would be required at the primary school to accommodate the number of pupils new development is anticipated to generate. However, the secondary school is located on a constrained site and so additional secondary level provision would require careful consideration.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	0
	<p>The site itself is relatively free of environmental constraints and it does not include, and is not in close proximity to, any statutory designated sites.</p> <p>Care should be taken to ensure that no harm is caused to mature trees located to the east and west of the site.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	xx
	<p>Built heritage assets (including Historic Parks and Gardens) - The site is located to the rear of a site of significant heritage value, the Church of St Mary and Holy Rood (a Grade I listed building) and its churchyard. The site is also significant for the setting of the Donington Conservation Area with which it shares part of its boundary. The site is an open field allowing views from the church and churchyard to the A52 bypass beyond. There is the potential for the Grade II* listed Church House, 36 Church Street to be affected, although the site has less significance with regard to the setting of the building due to the height of the garden wall. Development of the site would have a significant impact on the historic setting of the Church and the churchyard, as well as the Conservation Area. As it is a sensitive site in terms of the heritage value of the locality, the location and scale of the proposed allocation would result in harm if it was to be developed.</p>

	<p>Potential mitigation – none as the openness is a key characteristic; Potential enhancement – none.</p> <p>Archaeological assets - No major archaeological issues, further information may be required dependant on development. There may be some visual impact issues. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is located adjacent to the development limits of Donington – built development of this site is not likely to have an impact on the character of the landscape as it has development to the west, south and east and the A52 to the north, meaning that it does not have a countryside character.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Donington area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 2.12ha of grade 1 agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p>

	<p>The proposal would lead to the permanent loss of approx. 2.12ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: right;">✓✓</p> <p>This site is within Environment Agency Flood Zone 1 (no hazard, no depth). This means that the site is within a sequentially preferable location in terms of flood risk so generates a positive impact. Given the size of the site, a flood risk assessment is required to consider other sources of flooding. This should ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere, and, should where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Reference should be made to the South East Lincolnshire Strategic Flood Risk Assessment and National Planning Practice Guidance.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used, and through green infrastructure; natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: right;">✓/x</p> <p>Some facilities and services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. It is likely that the anticipated increase in 141 people would generate new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Donington. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Donington are currently at capacity and so reinforcement works would be required in order for new capacity to be released.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>

<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Donington – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this it is likely that new development could have a positive impact on the local economy by bringing 141 people within both the ideal 7km drive and 1km walk of employment opportunities in Donington (Millfield Road Industrial Estate). There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (141 people) will generate some additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>

<b>DON033: Land to the north of Church Lane, Donington</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 10.13ha Potential open space: 1.42ha Development area: 8.71ha  Potential no of dwellings: 203</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 472 dwellings proposed for the Donington area over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Donington and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to the development limits of Donington would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	✓/x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. Open space and the village playing field is located opposite Thomas Cowley High School, around 400m away and the Ruby Hunt [pop-in] Centre is approx. 480m from the site. However, the nearest health centre is Gosberton Medical Centre in Gosberton at about 5.7km away.</p> <p>It is anticipated that the increase in population – approximately 447 people (2.2 occupants in each of the 203 dwellings) - associated with this site would place considerable pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare</p>

	<p>and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Donington does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 1.42ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. The site is in close proximity to the A52 and so structural landscaping such as trees of mixed provenance, may be necessary to help mitigate any noise and air pollution.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Donington, Quadring and Gosberton) showed that 89.1% of households owned at least one car and 47.6% travelled to work by car/van, above the Lincolnshire averages of 82% and 42.1%.</p> <p>The site is well outside the ideal distance to a big supermarket (7km) – the car/van is likely to be the preferred mode of transport for this purpose. The centre of the site is within the ideal 1km distance of the local shop from a housing site, being around 730m from the Co-operative store in Market Place. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential traffic generated by this site on its own and with other housing nearby means that schemes to address traffic impact in and around Donington should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys. The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services currently operate 7 times daily (weekdays) between Spalding and Boston; the nearest bus stops around 630m from the site on the A52 near the junction with Church Street, outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Donington, Quadring and Gosberton: Compared with the Lincolnshire average, its long term unemployment rate was above average (34.4% compared to 25.6%). However, those without access to a car is below average (10.9% compared to 18%) while crime rate per 1000 is 25.7 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside</p>

	<p>other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>As discussed in Objective 13 the nearest employment site on High Street (700m) is well within the ideal 7km drive and 1km walk of the site. There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓/x</p> <p>The development would be likely to accommodate 203 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 41 primary pupils and 39 secondary pupils. The nearest primary and secondary schools are:</p> <ul style="list-style-type: none"> <li>• Donington Cowley Endowed Primary School is around 1km from the site</li> <li>• Thomas Cowley High School is approx. 590m away</li> </ul> <p>However, there are no post 18 education providers within the ideal walking distance. The car/van is therefore likely to be the preferred mode of transport for these journeys.</p> <p>The local education authority has indicated that Donington currently has a lack of capacity at primary and secondary level. Additional classrooms would be required at the primary school to accommodate the number of pupils new development is anticipated to generate. However, the secondary school is located on a constrained site and so additional secondary level provision would require careful consideration.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">0</p> <p>The site appears to be free of environmental constraints and it does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>

	As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.
<b>7. Heritage</b>	x
	<p>Built heritage assets (including Historic Parks and Gardens) – The site is of some significance. Although not within the conservation area, the Church Lane frontage of the site constitutes a surviving example of the (open) historic setting of the town. The Conservation Area boundary runs along part of Church Lane facing the site. The conservation area boundary at this point runs to the rear of Thomas Cowley High School. Church Lane is not therefore a key historic frontage in the Conservation Area, more a key component of its wider historic setting. Given that the site has an extensive frontage along the remaining length of Church Lane it will change the character of the Lane and the wider setting of the Conservation Area.</p> <p>Potential mitigation - As a relatively large site there is the opportunity for a significant landscape component to any proposed development scheme. If this could incorporate some essence of the openness that is a key characteristic of the contribution of the site to wider setting of the Conservation Area, this would be beneficial in terms of addressing the potential harm;</p> <p>Potential enhancement – none.</p> <p>Any development proposal should be informed by a Heritage Impact Assessment. The Assessment would need to address the impact of the proposal on the historic townscape and in particular how it would preserve and enhance the character and appearance of the adjacent conservation area.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	✓/x
	<p>The site is located adjacent to the development limits of Donington – built development of this site would alter the character and appearance of the area as it is a large site and is visible from the A52. Furthermore, the visual amenity of the residential properties opposite the site would be affected by restricting the open views across the site. Good quality, sensitive design, incorporating structural landscaping would help reduce the visual impact any development could have on the local landscape and soften any hard edges that may exist, as well as helping to mitigate potential pollution impacts of the adjacent A52 identified in Objective 2. Such impact will, however, be dependent on implementation and design.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	x
	<p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Donington area.</p>

	<p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains cross the site and must remain accessible. The design of the site should take this into consideration.</p> <p>South Holland District Council's contaminated land register indicates that there is some filled land on the site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 10.13ha of grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 10.13ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is a mix of Flood Zones 1 and 3a with a small area of Flood Zone 2; and is identified within the SFRA as 'no hazard' in terms of flood hazard and flood depth. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, there are very few reasonably available sites within the local area with a lower probability of flooding than this site. However, given the vulnerability of the use, both parts of the Exception Test will need to be applied and passed. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Donington for the plan period; and promoting strong, secure, socially inclusive and cohesive communities.</p>

	<p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>The majority of services and facilities are within the ideal walking distances from the site meaning that there may be less need to travel by car. Even so, as identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. It is likely that the anticipated increase in 447 people would generate a considerable number of new car journeys and hence carbon emissions. Good design and complementary transport measures could ensure the travel patterns of the new site are more sustainable.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in Donington. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Donington are currently at capacity and so reinforcement works would be required in order for new capacity to be released.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Donington – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this, it is likely that new development could have a positive impact on the local economy by bringing 447 people within both the ideal 7km drive and 1km walk of</p>

	<p>employment opportunities in Donington (Millfield Road Industrial Estate). There are also other employment opportunities within the ideal 7km drive in nearby Bicker and Swineshead. Spalding and Boston, with their more extensive employment opportunities, are further away.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (447 people) will generate a significant amount of additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network does not worsen and is detrimental to the economy.</p>
--	---

## Main Service Centres: Holbeach

<b>FLE007: Land to the east of Branches Lane, Holbeach</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 1.09ha Potential open space: 0.15ha Development area: 0.94ha Potential no of dwellings: 22
<b>1. Housing</b>	✓
	<p>Overall, the site has the potential to contribute towards the 2,202 dwellings proposed for Holbeach over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the South East Lincolnshire Plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Holbeach and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Furthermore, housing sites adjacent to defined settlement limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest health centre, leisure centre/playing pitches, amenity open space and community centre/village hall are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 48 people (2.2 occupants in each of the 22 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports/recreational facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Holbech does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.15ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	x
	It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Fleet) showed that 88.4% of households owned at least one car and 44.4% travelled to work by car/van, above the Lincolnshire average of 82% and 42.1%

	<p>respectively. The site is within the ideal 7km distance to a big supermarket being around 1.9km from the Tesco store in Holbeach (Boston Road South) -- the car/van is likely to be the preferred mode of transport for this purpose. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. However, the site is outside the ideal 1km walking distance of a local shop.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Holbeach should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Buses run through Holbeach to Spalding and Kings Lynn up to every 20 minutes, 7 days a week (Monday-Saturday). However, the nearest bus stop is outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics indicate that Fleet was not a deprived area: in 2015 compared with the national average, its long term unemployment rate was below average (18.8% compared to 26.8%). Furthermore, compared with Lincolnshire, those without access to a car is below average (11.6% compared to 18%) while crime rate per 1000 is 22.8 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Fle007 is outside the ideal walking distance of some services and facilities and public transport links meaning that it may be more difficult to achieve social inclusion.</p> <p>The new housing development may improve physical access to local employment. For instance, the nearest employment opportunities at Fleet Road Industrial Estate are approx. 560m away. There are also other employment opportunities within the ideal 7km drive in Fleet and Whaplode. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓</p>

	<p>The development would be likely to accommodate 22 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 4 primary pupils and 4 secondary pupils. The nearest education facilities schools are:</p> <ul style="list-style-type: none"> <li>• William Stukeley Church of England Primary School is around 1.9km from the site</li> <li>• University Academy Holbeach (with sixth form) and the National Centre for Food Manufacturing (University of Lincoln; providing post-18 education opportunities) are approx. 2.2km away.</li> </ul> <p>The local education authority has indicated that Holbeach currently has a lack of capacity at secondary and sixth form level. Additional places will therefore be required. At primary level, there is currently some capacity available, although the provision of a new primary school and extension of two existing primary schools is planned over the life of the proposed developments in the town, including beyond the plan period.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for resident's, particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>The site is relatively free from environmental constraints although its development may have an adverse impact on some mature trees within the site. To determine the value of these trees for wildlife, they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining trees and maximising opportunities for enhancement and mitigation.</p> <p>The site does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<p><b>7. Heritage</b></p>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<p><b>8. Landscape and Townscape</b></p>	<p style="text-align: center;">✓</p> <p>Development of the site is not likely to have an adverse impact on the character and appearance of the area. It is located behind a row of dwellings fronting onto Branches Lane and there are few public views into the site meaning that the visual impacts would be limited.</p>

	The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore increase traffic impact in the Holbeach area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.09ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as predominantly 'danger for most' in terms of flood hazard, with flood depths between '0.5-1.0m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that</p>

	<p>the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Boston for the plan period; and potential contribution to the quality and character of landscape and townscape If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Some facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. As identified in Objective 3 and Objective 4, travel to work use by car and the number of residents with access to a car is higher than for the rest of the county. It is likely that the anticipated increase in 48 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Holbeach area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Holbeach – as a main service centre - will contribute to a stronger local economy in</p>

	<p>South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this, it is likely that new development could have a positive impact on the local economy by bringing 48 people within the ideal 7km drive and 1km walk of employment opportunities in Holbeach (Fleet Road Industrial Estate). It is also within 7km of Fleet and Whaplode. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (48 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.</p>
--	---

**HOB002: Land to the south of Wignals Gate, Holbeach**

<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 39.62ha Potential open space: 5.55ha Development area: 34.07ha  Potential no of dwellings: 900</p>
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 2,202 dwellings proposed for Holbeach over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Holbeach and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites adjacent to development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓/x</p> <p>Open space and a playing field are located off Wheatsheaf Close approx. 1km from the site. However, other facilities and services that would help to maintain health and promote healthy lifestyles are over 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest health centre (Holbeach Medical Centre) and Holbeach Community Centre are both outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 1980 people (2.2 occupants in each of the 900 dwellings) – would place a considerable amount of additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Holbeach does not have enough open space to meet its resident's needs, so the additional population generated by this site and</p>

	<p>elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 5.55ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Holbeach Town) showed that 80.7% of households owned at least one car (below the Lincolnshire average of 82%) and 44.7% travelled to work by car/van (above the county average of 42.1%).</p> <p>The site is within the ideal distance to a big supermarket (7km) being around 1.6km from the Tesco store in Holbeach (Boston Road South) – the car/van is likely to be the preferred mode of transport for this purpose. However, the site is outside the ideal 1km distance of the local shop from a housing site (approx. 1.4km from Martins newsagents on High Street). The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs. If the site were designed with legible and safe access and egress for pedestrians, cyclists as well as vehicles, it could have a positive effect upon promoting sustainable travel options, and ensuring that they are available to residents throughout the site.</p> <p>The potential for a significant amount of additional traffic to be generated by this site means that schemes to address traffic impact in and around Holbeach should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services through the centre of Holbeach currently operate up to every 20 minutes, 7 days a week between Spalding and King's Lynn; the nearest bus stops well outside the ideal 400m walking distance, around 1.8km from the site adjacent Stukeley Hall Drive.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Holbeach Town: Compared with the Lincolnshire average, its long term unemployment rate was above average (37.5% compared to 25.6%). Statistics also show that the percentage of residents without access to a car is above average (19.3% compared to 18%). However, crime rate per 1000 is below the county average at 36.5 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p>

	<p>Some of the area's services and facilities are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan. However, some other services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13, the nearest potential employment opportunities at Fleet Road Industrial Estate (2.7km) are within the ideal 7km drive of the site. However they are not within the ideal 1km walk, although they could be cycled to. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 900 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 180 primary pupils and 171 secondary pupils. The nearest education facilities are:</p> <ul style="list-style-type: none"> <li>• William Stukeley Church of England Primary School around 1.5km from the site</li> <li>• University Academy Holbeach (with sixth form) and the National Centre for Food Manufacturing (University of Lincoln; providing post-18 education opportunities) approx. 2.1km away</li> </ul> <p>The local education authority has indicated that Holbeach currently has a lack of capacity at secondary and sixth form level. Additional places will therefore be required. At primary level, there is currently some capacity available, although the provision of a new primary school and extension of two existing primary schools is planned over the life of the proposed developments in the town, including beyond the plan period.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on several established internal tree belts and older boundary hedgerows. A number of drainage ditches also run through the site and it is bounded by the Old River Holbeach to the east. Development of the site would be likely to affect the ecosystem present by potentially affecting the water table and changing the availability of ground water and, unless carefully managed, surface water pollution will be a problem. Disturbance due to development can result in the movement of species, therefore undermining their sustainability.</p> <p>The site does not include, and is not in close proximity to, any statutory designated sites.</p>

	<p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">xx</p> <p>Built heritage assets (including Historic Parks and Gardens) – The site has heritage significance in its contribution to the historic and visual setting of Manor Farmhouse (Grade II listed). Development of the site would harm the traditional setting of the heritage asset and so it would be likely to have a very negative effect. Potential mitigation – none; Potential enhancement – none.</p> <p>Archaeological assets – No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓/x</p> <p>The site is adjacent to the development limits of Holbeach. It is partly bounded by residential development to the north and east with open fields to the south and west. Development of the site would increase the perceived extent of the settlement's built-up area; however development on this scale also offers opportunities to mitigate such impacts.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will significantly increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Holbeach area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Demand from the site may place a burden on the existing sewerage system - Anglian Water considers that the foul sewerage and water supply networks may require upgrading to serve the proposed growth or diversion of assets may be required. There is considered to be</p>

	<p>capacity available at Holbeach's Water Recycling Centre. However, across South East Lincolnshire Anglian Water have commented that, in terms of the surface water network, there are major constraints to the provision of infrastructure and/or treatment</p> <p>South Holland District Council's contaminated land register indicates that the site has areas of filled land and is crossed by a former railway line meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p> <p>The proposal would lead to the permanent loss of approx. 39.62ha of Grade 1 agricultural land.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 39.62ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is a mix of Flood Zone 3a and 2; and is identified within the SFRA as a mix of no/low hazard and danger for some with a small area of danger for most in terms of flood hazard, with flood depths including an area of no hazard and between 0-0.5m, with a small area of 0.5-2.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Holbeach for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk</p>

	<p>overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. It is therefore likely that the anticipated increase in 1,980 people would generate a considerable number of new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Holbeach area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Holbeach are currently approaching capacity and so any substantial load increase would trigger reinforcement.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Holbeach – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this, it is likely that new development could have a positive impact on the local economy by bringing 1,980 people within the ideal 7km drive of local employment with Fleet Road Industrial Estate approx. 2.7km from the site. This will also ensure that there is potentially an accessible workforce within the town catchment to continue to support business relocation or growth over the plan period. Good design will better enable residents to use sustainable transport from the site to access local employment at Fleet Road and in the town centre. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local</p>

	<p>economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (1,980 people) will generate a significant amount of additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions (particularly along the A17) do not worsen and are detrimental to the economy.</p>
--	--

<b>HOB006: Land to the east of the A151, Holbeach</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 29.26ha Potential open space: 4.10ha Development area: 25.16ha  Potential no of dwellings: 585</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 2,202 dwellings proposed for Holbeach over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Holbeach and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	x
	<p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are outside 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space and playing field (off Farmers Gate), health centre (Holbeach Medical Centre) and Holbeach Community Centre are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 1,287 people (2.2 occupants in each of the 585 dwellings) – would place significant additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Holbeach does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 4.10ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the masterplanning it would have a positive impact on this objective.</p>

	<p>Local air and noise pollution is likely to increase significantly with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health. Furthermore, the site is in close proximity to the A151 and A17 which may have an adverse impact on the amenities that would be enjoyed by new dwellings on the site. However, it is considered that development on this scale offers opportunities to mitigate such impacts effectively - Structural landscaping such as trees of mixed provenance, may be necessary along these boundaries to help mitigate any noise and air pollution as well as helping to minimise the visual impact generated through proximity to the road network.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Holbeach Town) showed that 80.7% of households owned at least one car (below the Lincolnshire average of 82%) and 44.7% travelled to work by car/van (above the county average of 42.1%).</p> <p>The site is within the ideal short driving distance to a big supermarket being around 1.3km from the Tesco store in Holbeach (Boston Road South). The site is also just within the ideal 1km distance of the local shop from a housing site, being around 990m from the One Stop convenience store on West End. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Holbeach should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services through the centre of Holbeach currently operate up to every 20 minutes, 7 days a week between Spalding and King's Lynn; the nearest bus stops around 960m from the site adjacent Fairfields, outside the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Holbeach Town: Compared with the Lincolnshire average, its long term unemployment rate was above average (37.5% compared to 25.6%). Statistics also show that the percentage of residents without access to a car is above average (19.3% compared to 18%). However, crime rate per 1000 is below the county average at 36.5 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse</p>

	<p>impact on social inclusion.</p> <p>As discussed in Objective 13, the nearest potential employment opportunities at Fleet Road Industrial Estate (2.4km) are within the ideal 7km drive of the site. However they are not within the ideal 1km walk, although they could be cycled to. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>Development of the site might result in the loss of some allotments. There is currently a deficit of allotments in South East Lincolnshire – development of the site could have a negative impact on residents ability to access green infrastructure for recreation as identified in Objective 6 and grow food locally which may have an indirect negative impact on carbon emissions identified in Objective 12, through the generation of more food miles and trips to shops for produce. Although it is not known whether they will be retained or moved, the site is large enough to accommodate them.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 585 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 117 primary pupils and 111 secondary pupils. The nearest education facilities are:</p> <ul style="list-style-type: none"> <li>• William Stukeley Church of England Primary School is around 890m from the site</li> <li>• University Academy Holbeach (with sixth form) and the National Centre for Food Manufacturing (University of Lincoln; providing post-18 education opportunities) are approx. 1.5km away</li> </ul> <p>The local education authority has indicated that Holbeach currently has a lack of capacity at secondary and sixth form level. Additional places will therefore be required. At primary level, there is currently some capacity available, although the provision of a new primary school and extension of two existing primary schools is planned over the life of the proposed developments in the town, including beyond the plan period.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>Development may lead to the loss of allotments on the site and could have an adverse impact on some mature trees as well as two ponds located there. New River Drain runs through part of the site as well as other drainage channels. Disturbance due to development can result in the movement of species, therefore undermining their sustainability. Mitigation may be required to offset any potential harm identified but this will depend upon implementation.</p> <p>The site does not include, and is not in close proximity to, any statutory designated sites.</p>

	There is no significant geodiversity at this site - it is unlikely that a development will have an impact.
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is entirely within the development limits of Holbeach and is bordered partly by residential development to the east and the A151 to the west. Although the site's development would greatly increase the perceived extent of the settlement's built-up area it would provide a natural extension to the development form of the town up to the A151.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees and loss of green infrastructure. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Holbeach area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>Water mains and sewers cross the site and a pumping station is located just outside the site at the south - these must remain accessible. The design of the site should take this into consideration.</p> <p>South Holland District Council's contaminated land register indicates that there is some filled land on the site meaning that there may be contaminated land issues. Structural planting (i.e. trees of mixed species and green infrastructure) would help to enhance and protect soil resources.</p>

	The proposal would lead to the permanent loss of approx. 29.26ha of predominantly Grade 1 agricultural land.
<b>10. Sustainable use of Land and Waste</b>	<b>x</b>
	<p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 29.26ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<b>x</b>
	<p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is within Environment Agency Flood Zone 3a and is identified within the SFRA as danger for most and danger for some with a small area of low/no hazard in terms of flood hazard, with flood depths mainly between '0m to 1m'. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that there are other more suitable sites in the locality that are subject to a lower level of flood risk meaning that the Sequential Test cannot be passed.</p>
<b>12. Climate Change</b>	<b>✓/x</b>
	<p>Many of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. It is therefore likely that the anticipated increase in 1,287 people would generate a considerable number of new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Holbeach area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Holbeach are currently approaching capacity and so any substantial load increase would trigger reinforcement.</p>

	The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.
<b>13. Economy and Employment</b>	✓/x
	The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Holbeach – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this, it is likely that new development could have a positive impact on the local economy by bringing 1,287 people within the ideal 7km drive of local employment with Fleet Road Industrial Estate approx. 2.7km from the site. This will also ensure that there is potentially an accessible workforce within the town catchment to continue to support business relocation or growth over the plan period. Spalding, with its more extensive employment opportunities, is further away.
	Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).
	The increased population (1,287 people) will generate a significant amount of additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions (particularly along the A17) do not worsen and are detrimental to the economy.

<b>HOB008: Land at north of Spalding Road, Holbeach</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.28ha Potential open space: 0.04ha Development area: 0.24ha Potential no of dwellings: 6
<b>1. Housing</b>	✓
	Overall the site has the potential to contribute towards the 2,202 dwellings proposed for Holbeach over the plan period.  The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Holbeach and SE Lincolnshire it will have a positive impact on this objective.  Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.
<b>2. Health and Well-being</b>	✓/x
	Some of the facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space and playing field is around 530m from the site off Farmers Gate. However, the closest medical centre (Holbeach Medical Centre) and Holbeach Community Centre are both outside the ideal walking distances.

	<p>It is anticipated that the increase in population - approximately 13 people (2.2 occupants in each of the 6 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Holbeach Town) showed that 80.7% of households owned at least one car (below the Lincolnshire average of 82%) and 44.7% travelled to work by car/van (above the county average of 42.1%).</p> <p>The site is within the ideal short driving distance to a big supermarket being around 1.3km from the Tesco store in Holbeach (Boston Road South). However, the is just outside the ideal 1km distance of the local shop from a housing site, being around 1.1km from the One Stop convenience store on West End. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Holbeach should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services through the centre of Holbeach currently operate up to every 20 minutes, 7 days a week between Spalding and King's Lynn; the nearest bus stops around 140m from the site opposite Netherfield, within the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Holbeach Town: Compared with the Lincolnshire average, its long term unemployment rate was above average (37.5% compared to 25.6%). Statistics also show that the percentage of residents without access to a car is above average (19.3% compared to 18%). However, crime rate per 1000 is below the county average at 36.5 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A</p>

	<p>balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Some of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan. However, some other services and facilities are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13, the nearest potential employment opportunities at Fleet Road Industrial Estate (2.5km) are within the ideal 7km drive of the site. However they are not within the ideal 1km walk, although they could be cycled to. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>Development of the site is not likely to lead to the loss of any infrastructure.</p>
<p><b>5. Education</b></p>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 6 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest education facilities are:</p> <ul style="list-style-type: none"> <li>• William Stukeley Church of England Primary School is around 960m from the site</li> <li>• University Academy Holbeach (with sixth form) and the National Centre for Food Manufacturing (University of Lincoln; providing post-18 education opportunities) is approx. 1.9km away</li> </ul> <p>The local education authority has indicated that Holbeach currently has a lack of capacity at secondary and sixth form level. Additional places will therefore be required. At primary level, there is currently some capacity available, although the provision of a new primary school and extension of two existing primary schools is planned over the life of the proposed developments in the town, including beyond the plan period.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<p><b>6. Biodiversity, Geodiversity and Green Infrastructure</b></p>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse impact on, and is likely to lead to the loss of, a number of mature trees on the site. Mature trees can be important habitats for a variety of species and so their removal could have an adverse effect on biodiversity through the loss and fragmentation of habitats. To determine the value of these trees for wildlife they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining as many trees as possible and maximising opportunities for enhancement and mitigation.</p>

	<p>The site does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is entirely within the development limits of Holbeach - development of the site is likely to have only a limited impact on the landscape of the area.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Holbeach area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>A pumping station is located adjacent to the site which must remain accessible at all times. The design of the site should take this into consideration.</p> <p>The site is not agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p>

	<p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 0.28ha of predominantly greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: right;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as a mix of no/low hazard and danger for some in terms of flood hazard, with flood depths including an area of no hazard and between 0-0.5m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Holbeach for the plan period; and protection of the quality and character of landscape and townscape. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: right;">✓/x</p>

	<p>As identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. However, the anticipated increase in 13 people may only generate a limited number of new car journeys and associated carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Holbeach area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Holbeach are currently approaching capacity and so any substantial load increase would trigger reinforcement.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	✓/x
	<p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Holbeach – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this, it is likely that new development could have a positive impact on the local economy by bringing 13 people within the ideal 7km drive of local employment with Fleet Road Industrial Estate approx. 2.5km from the site. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p>

<b>HOB009: Land to the north-west of Foxes Low Road, Holbeach</b>	
<b>Sustainability Objective</b>	<p>Indicative development scenario:  Total site area: 1.06ha Potential open space: 0.15ha Development area: 0.91ha  Potential no of dwellings: 21</p>
<b>1. Housing</b>	✓
	<p>Overall the site has the potential to contribute towards the 2,202 dwellings proposed for Holbeach over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Holbeach and SE Lincolnshire it will have a positive impact on this objective.</p> <p>However, housing sites detached from development limits would, in general, be contrary to the principles of the settlement hierarchy.</p>
<b>2. Health and Well-</b>	x

<p><b>being</b></p>	<p>Open space is located off King's Road approx. 560m from the site. However, the majority of facilities and services that would help to maintain health and promote healthy lifestyles are over 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest playing field and community centre (Holbeach Community Centre) and health centre (Littlebury Medical Centre) are all outside the ideal walking distances.</p> <p>It is anticipated that the increase in population - approximately 46 people (2.2 occupants in each of the 21 dwellings) – would place some additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Holbeach does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.15ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<p><b>3. Transport</b></p>	<p style="text-align: center;">x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Holbeach Town) showed that 80.7% of households owned at least one car (below the Lincolnshire average of 82%) and 44.7% travelled to work by car/van (above the county average of 42.1%).</p> <p>The site is within the ideal distance to a big supermarket (7km) being around 1.9km from the Tesco store in Holbeach (Boston Road South) – the car/van is likely to be the preferred mode of transport for this purpose. However, the site is outside the ideal 1km distance of the local shop from a housing site. The aspiration should be to create an area where sustainable travel is the choice, particularly for local journeys and everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Holbeach should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services through the centre of Holbeach currently operate up to every 20 minutes, 7 days a week between Spalding and King's Lynn; the nearest bus stops around 1km from the site on Fleet Road (Holbeach Damgate), outside the ideal 400m walking distance.</p>

<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: right;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Holbeach Town: Compared with the Lincolnshire average, its long term unemployment rate was above average (37.5% compared to 25.6%). Statistics also show that the percentage of residents without access to a car is above average (19.3% compared to 18%). However, crime rate per 1000 is below the county average at 36.5 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services, facilities and public transport links are outside the ideal walking distances which may have an adverse impact on social inclusion.</p> <p>As discussed in Objective 13, the nearest potential employment opportunities at Fleet Road Industrial Estate (1.4km) are within the ideal 7km drive of the site. However they are not within the ideal 1km walk, although they could be cycled to. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<p><b>5. Education</b></p>	<p style="text-align: right;">✓</p> <p>The development would be likely to accommodate 21 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 4 primary pupils and 4 secondary pupils. The nearest education facilities are:</p> <ul style="list-style-type: none"> <li>• William Stukeley Church of England Primary School is around 1.9km from the site</li> <li>• University Academy Holbeach (with sixth form) and the National Centre for Food Manufacturing (University of Lincoln; providing post-18 education opportunities) are approx. 2km away</li> </ul> <p>The local education authority has indicated that Holbeach currently has a lack of capacity at secondary and sixth form level. Additional places will therefore be required. At primary level, there is currently some capacity available, although the provision of a new primary school and extension of two existing primary schools is planned over the life of the proposed developments in the town, including beyond the plan period.</p>

	Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">✓/x</p> <p>Development of the site may have an adverse effect on trees and vegetation within the site. These can be important habitats for a variety of species and so their removal could have an adverse effect on biodiversity through the loss and fragmentation of habitats. To determine the value of these trees for wildlife they should be subject to a quality assessment. Good design could generate a positive biodiversity impact by retaining as many trees as possible and maximising opportunities for enhancement and mitigation.</p> <p>The site does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">x</p> <p>The site is detached from the development limits of Holbeach – Development of the site could have an adverse impact on the character of the area as it would result in an incongruous group of dwellings in this part of Holbeach. This impact may be minimised should this site be development in combination with Hob004 which would provide a natural extension to the development form of the town.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will significantly increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Holbeach area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p>

	<p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>This site does not appear to be in agricultural use.</p>
<p><b>10. Sustainable use of Land and Waste</b></p>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>Development of the site would lead to the loss of approx. 1.06ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<p><b>11. Flood Risk</b></p>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as a mix of no/low hazard and danger for some/most in terms of flood hazard. Flood depths include an area of no hazard and between 0-1.0m, with a small area of 1.0-2.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Holbeach for the plan period. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed</p>

	<p>proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>The majority of the areas facilities, services and public transport links are outside the ideal walking distances from the site meaning that there is less potential to reduce the need to travel by car. Furthermore, as identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. It is therefore likely that the anticipated increase in 46 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Holbeach area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Holbeach are currently approaching capacity and so any substantial load increase would trigger reinforcement.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>
<b>13. Economy and Employment</b>	<p style="text-align: center;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Holbeach – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this, it is likely that new development could have a positive impact on the local economy by bringing 46 people within the ideal 7km drive of local employment with Fleet Road Industrial Estate approx. 1.4km from the site. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p>

	The increased population (46 people) will generate additional traffic. Safe access and egress will be required to ensure that the impact on the local road network does not worsen and is detrimental to the economy.
--	---

<b>HOB013: Land to the north of Spalding Road, Holbeach</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 1.94ha Potential open space: 0.27ha Development area: 1.67ha Potential no of dwellings: 39
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 2,202 dwellings proposed for Holbeach over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Holbeach and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest open space is located off Fairfields around 280m away whilst the closest playing field is approx. 650m from the site off Farmers Gate. The nearest health centre is Holbeach Medical Centre situated around 910m away, however Holbeach's community centre is outside the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 86 people (2.2 occupants in each of the 39 dwellings) – would place additional pressure on the above existing facilities over the life of the Plan. Additional/improved healthcare and sports facilities near the site could be needed to meet the needs of future residents.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Overall, Holbeach does not have enough open space to meet its resident's needs, so the additional population generated by this site and elsewhere in the settlement could increase use of local open space reducing its overall quality. Based on the site area, about 0.27ha of open space may be required, which could be provided on-site to meet future needs. If this could be secured on-site through the planning process it would have a positive impact on this objective.</p> <p>Local air and noise pollution is likely to increase with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">✓</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Holbeach Town) showed that</p>

	<p>80.7% of households owned at least one car (below the Lincolnshire average of 82%) and 44.7% travelled to work by car/van (above the county average of 42.1%).</p> <p>The site is within the ideal short driving (7km) and walking (1km) distance to a big supermarket and/or local shop being around 980m from the Tesco store in Holbeach (Boston Road South) as well as the One Stop convenience store 690m away on West End. Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Holbeach should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services through the centre of Holbeach currently operate up to every 20 minutes, 7 days a week between Spalding and King's Lynn; the nearest bus stops around 350m from the site adjacent Fairfields, within the ideal 400m walking distance.</p>
<p><b>4. Socially Inclusive Communities</b></p>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Holbeach Town: Compared with the Lincolnshire average, its long term unemployment rate was above average (37.5% compared to 25.6%). Statistics also show that the percentage of residents without access to a car is above average (19.3% compared to 18%). However, crime rate per 1000 is below the county average at 36.5 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>The majority of the area's services, facilities and public transport links are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan.</p> <p>As discussed in Objective 13, the nearest potential employment opportunities at Fleet Road Industrial Estate (2.2km) are within the ideal 7km drive of the site. However they are not within the ideal 1km walk, although they could be cycled to. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p>

	No infrastructure will be lost on site as a consequence of this proposal.
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 39 dwellings. On average every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 8 primary pupils and 7 secondary pupils. The nearest education facilities are:</p> <ul style="list-style-type: none"> <li>• William Stukeley Church of England Primary School is around 600m from the site</li> <li>• University Academy Holbeach (with sixth form) and the National Centre for Food Manufacturing (University of Lincoln; providing post-18 education opportunities) are approx. 1.5km away</li> </ul> <p>The local education authority has indicated that Holbeach currently has a lack of capacity at secondary and sixth form level. Additional places will therefore be required. At primary level, there is currently some capacity available, although the provision of a new primary school and extension of two existing primary schools is planned over the life of the proposed developments in the town, including beyond the plan period.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">0</p> <p>The site appears to be free of environmental constraints and it does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p> <p>As discussed in Objective 11, sufficient sustainable drainage areas would be expected to be provided to meet the developments needs.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>Built heritage assets (including Historic Parks and Gardens) - No significant historic or culturally-significant features are likely to be affected by development of the site.</p> <p>Archaeological assets - No major issues, further information may be required dependant on development. Any further archaeological work would be undertaken in line with paragraph 128 of the NPPF. All proposed development that includes or has the potential to include heritage assets with archaeological interest should include a Heritage Assessment and, dependant on the results, further work prior to determination may be required, including assessments such as field walking, geophysical survey and trial excavation. There may then be additional requirements to further protect significant archaeology in situ or to record an archaeology before its destruction.</p>
<b>8. Landscape and Townscape</b>	<p style="text-align: center;">✓</p> <p>The site is entirely within the development limits of Holbeach and is bounded by residential development to the south and east. Any impact on the landscape would therefore be limited. Development of the site would provide a natural extension to the development form of the town.</p>

	The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">x</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate green infrastructure within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Holbeach area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The proposal would lead to the permanent loss of approx. 1.94ha of predominantly agricultural land.</p>
<b>10. Sustainable use of Land and Waste</b>	<p style="text-align: center;">x</p> <p>The development will lead to the consumption of minerals in the form of building materials during construction of the site. Sustainable waste management techniques should be employed on site to reduce waste and ensure resources are used as efficiently as possible. The environmental impact of this will depend upon the design of new housing development and associated infrastructure, particularly relating to the type and provenance of building materials, and building regulations governing developers.</p> <p>As the site would involve new development it is inevitable that there will be an increase in household waste production.</p> <p>The proposal would lead to the permanent loss of approx. 1.94ha of greenfield land.</p> <p>This site is not within a Mineral Safeguarding Area.</p>
<b>11. Flood Risk</b>	<p style="text-align: center;">✓/x</p> <p>The NPPF requires the application of the Sequential Test to steer new development to areas with the lowest probability of flooding. The South East Lincolnshire Strategic Flood Risk Assessment (SFRA) provides the basis for applying this test. This site is in Flood Zone 3a and is identified within the SFRA as a mix of and danger for most/some with a small area no/low hazard in terms of flood hazard, with flood depths including an area of no hazard and between 0-1.0m. Whether or not the Sequential Test can be passed depends upon the suitability of other sites available within the locality.</p> <p>In this instance, it appears that sustainable development cannot be achieved through locating development entirely within areas with a low probability of flooding, particularly given the level of housing need that must be met in the locality. This means that – given the</p>

	<p>vulnerability of the proposed use - the Exception Test should be applied. In order for this test to be passed, it must be demonstrated that the proposed development will provide wider sustainability benefits to the community that outweigh flood risk, and that it will be safe for its lifetime, without increasing flood risk elsewhere and where possible reduce flood risk overall. Taking into account the findings of this appraisal, it appears that the development would provide some wider sustainability benefits to the community through its ability to help meet the housing need identified for Holbeach for the plan period; improving health and wellbeing; contribution to sustainable transport options; and protection of the quality and character of landscape and townscape. If the development can be made safe for its lifetime, it is considered that these benefits would outweigh the flood risk.</p> <p>A Flood Risk Assessment must be conducted to ensure that the flood risk in the area has been appropriately assessed for the lifetime of the development, taking into account all sources of flooding and the impacts of climate change. The design of the development should take into account the vulnerability of its users, without increasing flood risk elsewhere and should, where possible, reduce flood risk overall from all sources. This will better enable appropriate mitigation and adaptation measures to be identified and incorporated into the design, layout and form of the site. Mitigation as outlined in the SFRA will need to be incorporated into the design of the detailed proposal.</p> <p>The appropriate use of Sustainable Drainage Systems (SUDS) could promote a positive impact and should be considered in first instance. It should be possible to help manage surface water run off through good design e.g. the type and extent of hard-standing used and through green infrastructure. Natural features would enable some natural soak away for surface water and provide for biodiversity, thereby helping to deliver Objective 6. Depending on the type selected this could also reduce pollutants in run-off as well as helping to deliver Objective 9.</p> <p>Appropriate connection to the existing sewerage system should ensure that the demand from new housing does not burden the existing network e.g. through sewer flooding.</p>
<b>12. Climate Change</b>	<p style="text-align: center;">✓/x</p> <p>Many of the area's services, facilities and public transport links are within the ideal walking distances which could help minimise the need to travel by car. However, as identified in Objective 3 and Objective 4, travel to work use by car is higher than for the rest of the County. It is therefore likely that the anticipated increase in 86 people would generate new car journeys and hence carbon emissions.</p> <p>New dwellings lead to the consumption of significant amounts of energy and resources, and therefore the release of greenhouse gases, in use and in construction. Building regulations mean that homes built will be significantly more energy efficient than the older homes in the Holbeach area. But the extent of the impact on this objective is dependent upon the scale and design of the development e.g. through the incorporation of energy efficient methods and renewable energy.</p> <p>Western Power Distribution considers that, in terms of the electricity network, the primary transformers in Holbeach are currently approaching capacity and so any substantial load increase would trigger reinforcement.</p> <p>The inclusion of landscaping within the development should have a positive effect upon carbon absorption particularly if a mix of species and provenance are used to better allow for climate change adaptation.</p>

<b>13. Economy and Employment</b>	<p style="text-align: right;">✓/x</p> <p>The settlement hierarchy in the draft SE Lincolnshire Local Plan guides the distribution and scale of development in a sustainable manner, reflecting the needs, roles and functions of each settlement. The Local Plan proposes that a focus on increasing housing and accompanying appropriate employment development in Holbeach – as a main service centre - will contribute to a stronger local economy in South East Lincolnshire as a whole, which will help reduce levels of deprivation and poverty more widely. Given this, it is likely that new development could have a positive impact on the local economy by bringing 86 people within the ideal 7km drive of local employment with Fleet Road Industrial Estate approx. 2.2km from the site. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Development on this site will generate employment during the construction period and thereby provide some protection to the local economy. It may also support those who provide services to homes (e.g. window cleaners and maintenance tradesmen).</p> <p>The increased population (86 people) will generate additional traffic. Schemes to minimise traffic impact in the area and enable sustainable transport use will need to be considered in order to ensure that impact on the local road network and at junctions (particularly along the A17) do not worsen and are detrimental to the economy.</p>
-----------------------------------	---

<b>HOB023: Land to the west of Barrett's Close, Holbeach</b>	
<b>Sustainability Objective</b>	Indicative development scenario: Total site area: 0.15ha Potential open space: 0.02ha Development area: 0.13ha Potential no of dwellings: 5
<b>1. Housing</b>	<p style="text-align: center;">✓</p> <p>Overall the site has the potential to contribute towards the 2,202 dwellings proposed for Holbeach over the plan period.</p> <p>The Strategic Housing Market Assessment has identified the need for new housing over the plan period. If the type, tenure and affordability of the housing to be constructed on this site helps deliver the housing need identified for Holbeach and SE Lincolnshire it will have a positive impact on this objective.</p> <p>Housing sites within development limits would, in general, be more important to the delivery of the settlement hierarchy.</p>
<b>2. Health and Well-being</b>	<p style="text-align: center;">✓</p> <p>The majority of facilities and services that would help to maintain health and promote healthy lifestyles are within 1km (600m for a community/village hall), the ideal walking distance from housing development for such facilities. The nearest sports facilities (tennis courts, bowling green, playing field and outdoor basketball) and open space are located around 460m from the site at Carter's Park whilst the closest health centre is Holbeach Medical Centre situated around 440m away. However, Holbeach's community centre is outside the ideal walking distance.</p> <p>It is anticipated that the increase in population - approximately 11 people (2.2 occupants in each of the 5 dwellings) – associated with this site, and cumulatively with other new development, could put some pressure on these facilities over the plan period. However given</p>

	<p>the size of the site, developer contributions are not able to be sought. Should additional/improved healthcare, sports facilities or open space be required, other funding sources would need to be used.</p> <p>The Clinical Commissioning Groups have commented that there is capacity in the short-medium term at the local GP surgeries to accommodate additional patients. However, County-wide there is an increasing shortage of GP's, nurses and other healthcare staff which could affect future capacity should demand increase.</p> <p>Local air and noise pollution is likely to increase slightly with the new development through increased traffic, which together with the impact from other developments elsewhere in the settlement could have a negative impact on physical and mental health.</p>
<b>3. Transport</b>	<p style="text-align: center;">✓/x</p> <p>It is likely that new residents will replicate existing patterns of car dependency – ONS 2011 census data (Holbeach Town) showed that 80.7% of households owned at least one car (below the Lincolnshire average of 82%) and 44.7% travelled to work by car/van (above the county average of 42.1%).</p> <p>The site is within the ideal short driving (7km) and walking (1km) distance to a big supermarket and/or local shop being around 150m from the Tesco store in Holbeach (Boston Road South). Consequently, the site would create a development where sustainable modes of travel can be used in order to meet residents' everyday shopping needs.</p> <p>The potential for additional traffic to be generated by this site means that schemes to address traffic impact in and around Holbeach should ensure that any increase in traffic does not restrict access to jobs and services, and promotes safe, easy use for all. On the other hand increased traffic may encourage people to seek alternative sustainable options, particularly for local journeys.</p> <p>The site will not directly impact upon, and therefore contribute towards, any major transport routes in the area.</p> <p>Bus services through the centre of Holbeach currently operate up to every 20 minutes, 7 days a week between Spalding and King's Lynn; the nearest bus stops around 590m from the site near the William Stukeley Church of England Primary School, outside the ideal 400m walking distance.</p>
<b>4. Socially Inclusive Communities</b>	<p style="text-align: center;">✓/x</p> <p>ONS statistics depict a varied picture in relation to the deprivation of Holbeach Town: Compared with the Lincolnshire average, its long term unemployment rate was above average (37.5% compared to 25.6%). Statistics also show that the percentage of residents without access to a car is above average (19.3% compared to 18%). However, crime rate per 1000 is below the county average at 36.5 compared to 49.7.</p> <p>The type, tenure and affordability of housing on the site should be informed by an analysis of the function this site should play, alongside other housing sites, in meeting the overall housing need identified in the SHMA. If it meets this need, it could have a positive effect upon inclusivity by enhancing the range of properties available, including for those on a low income, older people and those with disabilities. A balance may need to be struck between the development of market housing and affordable housing, to ensure that development can help provide for all infrastructure needed to deliver new housing. Quality affordable and market housing could also generate more</p>

	<p>energy and water efficient homes which could help reduce fuel poverty and lower bills for residents.</p> <p>Many of the area's services and facilities are within the ideal walking distances which could aid social inclusion in line with the sustainability objectives of the draft Local Plan</p> <p>As discussed in Objective 13, the nearest potential employment opportunities at Fleet Road Industrial Estate (1.7km) are within the ideal 7km drive of the site. However they are not within the ideal 1km walk, although they could be cycled to. Spalding, with its more extensive employment opportunities, is further away.</p> <p>Good design could have a positive effect upon crime by ensuring that the design of new housing promotes safe, sustainable and inclusive communities where the opportunity for crime and anti social behaviour is minimised.</p> <p>No infrastructure will be lost on site as a consequence of this proposal.</p>
<b>5. Education</b>	<p style="text-align: center;">✓</p> <p>The development would be likely to accommodate 5 dwellings. On average, every 5 homes of new housing generates 1 primary age pupil and every 7 new houses generates 1 secondary aged pupil. The development would therefore be likely to generate 1 primary pupil and 1 secondary pupil. The nearest education facilities are:</p> <ul style="list-style-type: none"> <li>• William Stukeley Church of England Primary School is around 530m from the site</li> <li>• University Academy Holbeach (with sixth form) and the National Centre for Food Manufacturing (University of Lincoln; providing post-18 education opportunities) are approx. 1.1km away</li> </ul> <p>The local education authority has indicated that Holbeach currently has a lack of capacity at secondary and sixth form level. Additional places will therefore be required. At primary level, there is currently some capacity available, although the provision of a new primary school and extension of two existing primary schools is planned over the life of the proposed developments in the town, including beyond the plan period.</p> <p>Development on this site will generate employment during the construction period, which may involve apprenticeships or employment of the local long term unemployed, which could help improve job prospects and prosperity for residents particularly young people.</p>
<b>6. Biodiversity, Geodiversity and Green Infrastructure</b>	<p style="text-align: center;">0</p> <p>The site appears to be free of environmental constraints and it does not include, and is not in close proximity to, any statutory designated sites.</p> <p>There is no significant geodiversity at this site - it is unlikely that a development will have an impact.</p>
<b>7. Heritage</b>	<p style="text-align: center;">0</p> <p>No significant historic or culturally-significant features are likely to be affected by development of the site.</p>
<b>8. Landscape and</b>	<p style="text-align: center;">✓</p>

<b>Townscape</b>	<p>The site is entirely within the development limits of Holbeach and is bounded by residential development to the north, east and west – it would form an infill development. Any impact on the landscape would therefore be limited.</p> <p>The contribution, positive or negative, that the development could make to townscape would depend upon the quality of the design.</p>
<b>9. Air, Soil and Water Resources</b>	<p style="text-align: center;">✓</p> <p>Development upon this site would inevitably have some effect upon air quality. The construction process would result in the generation of dust, the release of emissions from construction vehicles and the potential disturbance of trees. The extent to which air quality would be affected by development would depend upon mitigation measures to limit emissions and control dust within the construction process and incorporate vegetation within the new development. It is likely that new housing development will increase traffic levels, with the current trend of car dependency likely to continue; and therefore potentially increase traffic impact in the Holbeach area.</p> <p>Development could have some impact upon water quality through the construction process and through the development itself. As discussed in Objective 11 this could to some extent be mitigated by effective surface water management to ensure that pollutants in run-off are kept out of the groundwater.</p> <p>New dwellings inevitably consume water in use; implementation of water efficiency and conservation measures through construction could help mitigate this impact. Appropriate connection to the potable water distribution network would be required to ensure that the new housing has an appropriate water supply.</p> <p>The site is not agricultural land.</p>
